In some such light the examination must appeal to the poor candidate, who has no choice but to struggle with such questions, and pass in his paper as a specimen of the very best writing he can do; and all the time he knows he could do vastly better if he were only given a chance to write on topics within his grasp. But there is no way out of it; that paper, which so misrepresents his real powers, which almost inevitably represents his worst, helps decide whether or not he enters college.

A careful inspection of entrance examinations in English for several years past reveals a large proportion of questions demanding criticism and analysis of character. Now, intelligent criticism or analysis of persons and situations is a pretty sure sign of maturity. And yet a candidate fresh from a secondary school is expected to show an insight into character and a judgment of persons and things which comparatively few older people possess.

Not only does the average examination seem unfair to the candidate in that it gives him little opportunity to exhibit his best work; but also, it is in defiance of a cardinal reason for thorough instruction in English composition. I suppose, there is no higher aim in the teaching of English composition than that stated by President Eliot, as one of the main processes or operations of mind which systematic education should develop in the individual, namely, "the function of making a correct record of things observed." The usual examination question does not encourage or allow a statement of things observed by the candidate, except indirectly, through the eyes or minds of others. Rather, it encourages or requires him to state what Scott, or Dickens, or Shakespeare observed, or, parrot-like, to repeat scraps of what some critic observed in Scott, or Dickens, or Shakespeare.

Not that the college entrance examinations would be better, if all questions on reading were omitted; far from it. A part of the examination should test the candidate's knowledge of literature, and literature should become as much a portion of the pupil's life as possible. But this part of the examination should be primarily a test in literature. A part should be devoted wholly to a test in composition; on subjects, too, which involve careful observation and which reflect the life and experiences of the writer. Many a boy who cannot give an effective picture of Torquilstone Castle can write a most vivid description of his home town. The objection may be made that it would be difficult to make out questions for such a test; that they would either not be broad enough to include all candidates, or so broad as to permit the use of composi-

tions previously written with care and memorized. But by allowing a choice of several questions, as at present, and by a little ingenuity in framing them, these difficulties would be easily overcome.

Harvard has already taken steps in the direction of allowing a candidate to write on subjects outside his reading in English classics. In recent Harvard entrance papers, beside the usual type of question on books read, are optional questions on school sports, science, popular government, and history; and in an examination for anticipating freshman English appears the topic for composition, "Describe the most interesting house you know." It is to be hoped that this is only the beginning of a movement to test candidates not so much on what somebody else said about something as on what they themselves have to say.

THE PRONUNCIATION OF LATIN.

TO THE EDITOR OF THE NATION:

SIR: Your readers may perhaps form a more intelligent judgment upon the question how Latin should be pronounced in schools and colleges, if they bear in mind that the same studies that are pursued by some students with a view of becoming specialists and experts are taken up by others for the sake of intellectual discipline, or merely in order to acquire serviceable information. All will agree that a student who has only a limited time to spend upon a subject, and who, accordingly, can at best acquire only a superficial acquaintance with it, should take it up in the way that will enable him best to profit by his study. Thus while the classical scholar must make himself familiar with all the peculiarities of all the dialects, and with both customary and exceptional usages, men in pursuit only of a good general education had better move along the lines that will most promptly bring them to some acquaintance with the thought of the ancients and with the literature in which it is expressed.

The scientific advantages promised by the Roman pronunciation the English pronunciation necessarily forego.s. But although the English mode, like that of most modern languages, is full of inconsistencies and irregularities, it conforms to the received pronunciation of the Latin words and phrases that form so conspicuous a feature in English speech and literature. These include the many familiar quotations in common use and the technical language of the law courts, hardly less current, as well as the hundreds of proper names of persons, towns, countries, rivers, and mountains. Even Greek names are spelled and pronounced, in good society, in spite of Mr. Grote and his somewhat pedantic followers, as if they were Latin. This pronunciation conforms also, in the main, to that of the very large number of English words, constituting from a quarter to a half of the language, that are derived directly from Latin, and to that of our scientific nomenclature, in which even the words that are manufactured immediately from Greek materials are regularly regarded as having come into English through Latin, and, like the classical proper names just mentioned, are made to conform, however arbitrarily, to a Latin spelling and an English pronunciation.

Under these circumstances it would seem as if it might be wise to adhere to the traditional pronunciation with elementary classes. The students, comprising a majority of the men and women in both schools and colleges, who take up Latin, as they do algebra or astronomy, because they regard a subject of so much historical importance as an essential element in a liberal education, are content with moderate attainments. It would seem unnecessary to force upon them an exotic orthoepy which they do not need, and which may prove, as it has often been found, a real hindrance. The more historically accurate and strictly scientific "Roman" manner of speaking might be reserved for the smaller number who are minded to take up advanced Latin. At that stage of progress, they would quickly and easily acquire it.

In these days of electives, the choice of studies, in schools as in colleges, lies mainly with the students, and the more that is done to remove obstacles, the more students will be attracted to these humanities, and civilization leavened by their spirit.

JOHN COTTON'S INFLUENCE ON VANE.

TO THE EDITOR OF THE NATION:

SIR: In a letter in the *Nation* of April 8 upon John Cotton and Sir Henry Vane, Dr. Henry M. King takes exception to a statement of mine in a paper on John Cotton read before the Massachusetts Historical Society, to the effect that Vane was influenced by Cotton's views of church government—what was known as "the New England way." I observed that the influence of those ideas upon Vane and the men of Cromwell's army is brought out in such books as Borgeaud's "Rise of Modern Democracy in Old and New England." Dr. King says that Borgeaud makes no allusion to any influence of Cotton on Vane. It is true that he does not specifically name Vane among the English independents influenced by the New England views of church government, as he does not mention the men of Cromwell's army specifically influenced by John Cotton. But he devotes half a dozen pages (pp. 82-88) to the influence altogether of "the New England way" in shaping the new independent party in England, in which Vane was prominent, singling out John Cotton and Thomas Hooker for special mention in tracing this influence. The fact of the influence is indisputable; and Cotton was indisputably the most conspicuous and influential exponent of "the New England way," viz., independency. It was as "the New England way" that independency was constantly referred to in England in the period when "the agreement of the people" came into being.

J. Wingate Thornton, in his "Historical Relation of New England to the English Commonwealth," says with entire warrant:

> The polity of the strong men, Goodwin, Owen, Peters, Vane, Milton, Cromwell, and their fellows, to whom under God was confided the immediate future of England, was moulded in the freer life and thought of New England, by their correspondents and fellow workers, Cotton, Williams, and their fellows.

This was brought out much more fully, though not more clearly, by Hosmer, in his "Life of Sir Henry Vane," than by Borgeaud; and in his pages (164-170) those who are interested can study more carefully the reasons for viewing Vane as "a principal channel" of the influence of New England independency to England, and for Thornton's judgment that it was "in Cotton's study" that Vane was trained in the cardinal principles of independency. When he came to Boston to live with John Cotton, he was not an independent, and when he went back to England he was. The inference would seem to be simple. "Preceptor" of Vane—viz., preceptor in "the New England way"—the term applied to Cotton by Mr. Adams in his inscription on the Cotton monument, is certainly warranted; as it is also certain that the learner advanced far beyond the teacher.

With Mr. King's observations upon the relative merits and influence of Cotton and Vane as concerns toleration, I should not be disposed to take issue; but that subject was not with me under discussion.

EDWIN D. MEAD.

Philadelphia, April 28.

THE POETS OF YALE.

TO THE EDITOR OF THE NATION:

SIR: It would be interesting to know when was made the remark with which you say in your issue of April 29 that Theodore D. Woolsey is credited, "that Francis Miles Finch, author of 'The Blue and the Gray' was the only poet that Yale ever produced." Woolsey could hardly have said so in the later sixties, for by then Stedman had become recognized and so had Sill and Weeks. Perhaps Woolsey did not last long enough to know "Ye Lay of Ye Woodpeckore," and of course he did not know the poems of another living Yalensian, of the class of 1890, whose work is arousing much hopeful expectation.

A statement as to Yale or any other university "producing" poets, "must give us pause." If Woolsey wanted to say that so far as the atmosphere of Yale was influenced by the corporation and faculty of his time, it was not favorable to the production of poets, many who knew it well would not be apt to differ with him. Stedman and Sill were both requested by the faculty to remove themselves from the atmosphere, though Sill was allowed to come back. Weeks's relations with the powers were little, if any, more congenial than those of the other poets. Stedman and Sill both survived to happier days, but I believe that neither of them was ever invited to the faculty of Yale, despite the fact that Sill's influence at the University of California was perhaps the most inspiring educational influence of the time, and is vibrating still.

About the same time, Noah Porter was elected to succeed Woolsey, and Gilman was left at the University of California until the Johns Hopkins trustees gave him the recognition for which those of his own alma mater were too blind.

A SURVIVOR.

New York, May 1.

[The remark attributed to the late President Woolsey apropos of F. M. Finch was printed in the Ithaca *Journal* and the Cornell *Alumni Press*, in a note announcing

the poems. The responsible author of that note is an old member of the Cornell faculty and a friend of Judge Finch, who has known about the remark "for thirty years," but cannot recall exactly when and where it was made. It might therefore be considered as an oral tradition among the old friends and colleagues of Judge Finch at Cornell. Perhaps the query of "Survivor" will bring more definite information.—The Reviewer.]

BUDDING GENIUS.

To the Editor of The Nation:

Sir: What greater reward has the teacher of English than to discover in some one of his students unmistakable signs of budding genius? Such reward was mine this morning after class, when I found scribbled on the back of a freshman theme the following soul-effusion, evidently composed under the inspiration of my lecture on "Means of Securing Variety in Sentence Structure":

On heart and soul grave deep and fast
This splash sublime,
Whose memoried radiance shall outlast
The doom of time:

And through eternities unseen
For light suffice—
Because there may not be this green
In Paradise.

I think that is pretty good for a freshman. Addison Macaulay Scraggs.

Pisgah College, May 3.

P. S. A colleague suggests that the stanzas may have been copied. He thinks he recalls having seen "This splash sublime," or something like it, in one of the May magazines. But that is absurd.

A. M. S.

MASTER CARDELIUS.

To the Editor of The Nation:

Sir: I am pained indeed to find from your issue of May 6 that the only person who cared enough for the memory of the master (for such he is to me) Cardelius to answer the inquiry concerning him, has fallen so grievously into error, and has apparently endeavored to enliven his reply with quips which in their content show the lack of respect and appreciation so lamentably common in these later days.

Master Joachim Cardelius flourished, to be sure, in the sixteenth century, but he was neither a native of Franconia nor the son of a physician. Frankenau—the native place of Master Joachim—does not become Franconia by translation or transliteration, however much the prejudice of a New Hampshire or French Canadian bringing-up may have impelled your informant so to think. Moreover, his father, far from being a physician, was the village barber. It is generally known, of course, that the gentlemen of this profession, now so sadly lowered, combined in the period of Master Joachim surgery of the flesh with regulation and adornment of the skin. The allusion to bleeding—the commonest form of medicinal practice then—may have well led to confusion in reading the passage hastily in Zedter, "Gross. Vollständ. Universal Lexikon" (Halle, 1702 and ff.), from which your correspondent seems to have compiled his information. This source of information, I may add, is notoriously incorrect. A supplement to it was planned, for which a further and more faithful account of Master Joachim had been written by his disciple Andreas Keinmensch. This supplement, however, ceased publication with the volume ending at Caq, and the learned world has been since left at the mercy of the errors in the earlier edition of Zedter. Keinmensch's manuscript, however, still exists in the archives of his native town, Rothenstein; and it is devoutly to be hoped that your correspondent or some one else may translate it in full or at least make public more of it than I possess in the transcript made by me some forty years past. It is not within my strength nor within my rights to claim further space in these columns to devote to more detailed criticism of your correspondent's information, but I cannot close without a word in reference to the absurd statement that Master Joachim wrote a treatise upon garlic. To one who admires and reveres the mental and physical personalities of northern Europeans, a man who devoted himself to such a subject could be little less than anathema, and a pestilent pedant. The word which has been translated as garlic should be rendered as sorrel—common or garden sorrel—a herb now much neglected for its savor, but formally highly esteemed and much used.

Harmon Karl.

Detroit, Mich., May 8.

Notes.

At an early date we are to have from the Harpers a book of dramatic verse, by William Dean Howells. It is called "The Mother and the Father."

Houghton Mifflin Co. has just completed its Warwickshire edition of the complete works of George Eliot, consisting of 25 volumes, illustrated with 169 full-page photogravure pictures from photographs and drawings. Besides the novels, this edition includes George Eliot's Essays and the two-volume biography by Cross.

Sir Harry Johnston has arranged with Methuen & Co. to publish a volume on "The Negro in the New World." The work, some chapters of which have already appeared in the London *Times*, is the result of the author's recent journeys in the United States, West Indies, and Tropical America.

Mrs. Piozzi, whose marriage to the Italian singer raised such a tempest in the circle of Dr. Johnson and Fanny Burney, is to have a monument in Tremeirchion Church, where she was buried in 1821. This memorial is due to O. B. Fellowes, whose grandfather was her executor.

For the general reader, there is no better book on the subject than "The Panama Canal, and Its Makers," by Vaughan Cornish (Little, Brown & Co.), not merely because it is the most recent, but because it is the work of a British geographer, who has taken the pains to get the most authoritative information, to supplement and vivify it by personal observations, and to put it into a clear and compact form. The diplomatic history of the enterprise, the rival plans and engineering difficulties, the success in sanitation, the labor question, and the commercial possibilities are all briefly and competently discussed, without the sensationalism and bias that vitiate much of the current literature of the subject. Mr. Cornish is naturally most interested in the geographical aspects of the canal, especially its effects on trade routes and the civilization of the tropics. He emphasizes the fact that "the Panama Canal will not bring any port in Australia or the East Indies, nor any ice-free port in Asia or Asiatic Islands, nearer to any European port." But since the United States is not able to compete in international commerce, owing to the expense of constructing and operating American steamships, he thinks there are some grounds for the opinion that the canal is being built with American money for the use of Europe and Japan. He finds the American women on the Isthmus looking happy though somewhat bored, and the children, on account of their open-air life, seeming to thrive better than in the cities of the United States. He concludes that modern sanitary science has opened the tropics to the permanent occupation of the white man even as a laborer, but thinks that the Mediterranean races will be superior to the Anglo-Saxon for tropical colonization.

A volume on "The Christian Minister and his Duties" (imported by Charles Scribner's Sons) bears on its title page the name of the Rev. J. Oswald Dykes, one of the most honored Presbyterian divines of England, now principal emeritus of Westminster College, Cambridge. For fifty years Principal Dykes has served honorably in the pastoral office, and for twenty years he was a successful teacher of homiletics and practical theology. His lectures on the usual themes of that department of ministerial education are distinguished by sanity of view and force of utterance, with especial attention to historical treatment. One notes a wise perspective in his counsels, the result of sympathetic and wide study of many forms and ages of Christian activity. Particular attention is paid to the principles and methods of the conduct of public worship in non-liturgical churches.

A bird's-eye view of the present endeavors of Protestant missionaries and missionary organizations is afforded by Edwin Munsell Bliss's "The Missionary Enterprise" (Fleming H. Revell Co.). After a brief history of early Christian and mediæval missions, and the first attempts of the Roman Catholics and Protestants, the rapid development of the modern missionary movement in its various phases is traced with care, and the extension of Christianity in the chief missionary fields is outlined. The failing of most concise sketches of this sort is too great abundance of detail, owing to the temptation to omit nothing which has a claim to importance. Dr. Bliss has been a life-long student of his subject, and is a trained writer and observer. His skill is exhibited in this volume, in which the large facts and salient principles are brought to due prominence, notwithstanding the extent of field and fact which he covers. His volume will serve to spread intelligence as to the ambitions and purposes which underlie the efforts of the more statesmanlike propogandists of the faith, and the substantial

and permanent results which missionary effort is assuredly accomplishing.

A sincere and gracious tenderness attached to all words and deeds of the late Charles Cuthbert Hall, president of the Union Theological Seminary, and one finds this gentleness in appropriate setting in the posthumous volume of sermons to children, "The Silver Cup" (Houghton Mifflin Co.). The discourses appear to have been spoken when Dr. Hall was pastor of the First Presbyterian Church of Brooklyn at special afternoon services for children and youth. The book is prefaced by four stanzas of a hymn "Levavi Oculos," which might well find a place in a hymnal for children. The same spirit attended President Hall's second series of Barrows Lectures on the Haskell foundation of the University of Chicago, now published under the title, "Christ and the Eastern Soul" (The University of Chicago Press). With rare tactfulness and grace Dr. Hall undertook to discover "elements of sublimity in the Oriental consciousness"; and while maintaining "the distinctive moral grandeur of the Christian religion," he sought to demonstrate to his Eastern hearers that it is their privilege not only to accept Christianity, but also to aid the West in understanding and realizing it, in a manner in which it has not yet heen appreciated or comprehended. He says:

> The Oriental consciousness has the gifts that the world needs to offset its strenuous externalism and guide it back to the secret place of the Most High. The Contemplative Life, the Presence of the Unseen, the Aspiration for Ultimate Being, Reverence for the Sanctions of the Past, are the four gospels with which a Christian East may reëvangelize the West; giving it hack the spirit of the first days; coöperating with it to lead the world out of its confusion, grossness, and sin, into the peace and purity of Jesus Christ.

A new text-book on methods of pulpit discourse is "The Preacher: His Person, Message, and Method," by Prof. Arthur S. Hoyt of Auburn Theological Seminary (The Macmillan Co.). Dr. Hoyt's counsels are discreet, if not brilliant. His ideals appear in the following sentences:

> Over against a sensational pulpit, with its worldly standards of immediate and tahulated results, is placed a spiritual service tested by spiritual measures and motives. Above the superficial sway of eloquence is exalted an instructive pulpit that comes from the growing knowledge of the Gospel and of life, and results in a stahle, balanced, and comprehensive Christianity.

For nearly a hundred and fifty years the Brick Presbyterian Church has occupied a position of commanding influence in the religious life of the city of New York. The founders of the old church on Beekman Street included representatives of the most substantial families of the colonial city, and from that time to the present the Brick Church has held the allegiance of many of New York's most worthy men and women. It has been fortunate in its clergymen. While, perhaps, one would not go to its roll of pastors for the most brilliant pulpit orators, there is not to be found there, with, perhaps, one exception, the name of a single man who has not exerted deep influence upon many individuals. The history of the church, therefore, has an interest far beyond the circle of those who are personally concerned in it. It has been well told, with evident sympathy and personal loyalty, in a dignified volume of over five hundred pages, by the Rev. Shepherd Knapp, for some years one of the assistant ministers, "A History of the Brick Presbyterian Church in the City of New York" (New York: Published by the trustees of the Brick Presbyterian Church). The fortunes of the Church of the Covenant, intimately connected with those of the Brick Church, are narrated, and, of course, the work in this city of the Rev. Dr. Henry van Dyke and Dr. Maltbie D. Babcock.

According to the natural prompting of our local circumstances, the work in anthropology in our country has heen mainly done by investigators who were more interested in Arizona than in Hellas, in the Zuñi than in early Minoan culture. The Committee for Anthropology in the University of Oxford has attempted, on the other hand, to rouse interest in their subject by attacking it from the classical point of view. "Anthropology and the Classics" (Henry Frowde) contains six lectures delivered before the University by as many men of distinctly classical learning. Arthur J. Evans describes the diffusion of pictography throughout Europe; Andrew Lang, the anthropological elements in Homer; Gilbert Murray, certain of these elements in the non-Homeric epic tradition; F. B. Jevons summarizes many points concerning Græco-Italian magic in ancient times; J. L. Myres treats of anthropological details and views in Herodotus; and W. Warde Fowler discusses the ritual of *lustratio*. The lecture by Mr. Myres is by far the most philosophical of all in its method, and especially in this year of Darwin celebrations it might open the eyes of our present-day scientists to read Mr. Myres's account of the existence in the early Greek philosophy of a theory of the distinct biological evolution of man from a lower type of animal life. The other lectures of the series are more picturesquely objective. It is amusing to notice that this consultation of doctors could not pass without professional disagreement, Dr. Lang scoffing with wonted light gayety at the theory of a "Bowdlerized" Homeric tradition of manners and morals, and insisting that the Iliad and the Odyssey are "prehistoric, the flowers of a brief age of Achæan civilization, an age when the society of princes and ladies had a taste extraordinarily pure and noble," while Dr. Murray thereafter patiently reaffirms his doctrine of expurgation. We should like to believe with Mr. Lang in all the romantically white purity and high courtesies of his early Achæan troubadour courts, but it is hard to do so. Classical scholars will be interested to note that Mr. Warde Fowler has surrendered the belief, set forth in his "Roman Festivals," that the running of the Roman *Luperei* around the *pomerium* on each fifteenth of February was a true *lustratio urbis*.

The Versammlung deutscher Philologen und Schulmänner holds its fiftieth ("jubilee") meeting at the University of Graz (Austria), September 28-October 1, 1909. The association is, however, older than the number of its approaching session might appear to imply, for during recent years it has met biennially instead of annually. In recognition of this fiftieth meeting, it is proposed to form a fund by voluntary contributions, the income of which is to be used in the furtherance of classical and archæological research in such ways as the association may determine at its Septemher meeting. It is thought that Germans resident in America, and Americans who as students have enjoyed the hospitality of German universities, may be glad to share in this undertaking. Contributions may be sent to Prof. Elmer Truesdell Merrill, at the University of Chicago, who will forward the amounts and the names of donors to the committee of the association.

Two more volumes are needed to complete the new sixth edition of "Meyers Grosses Konversationslexikon." The eighteenth volume, *Schöneberg—Sternbedeckung*, which has just reached us, shows that increasing emphasis is heing laid on industrial and technical topics, always a strong feature in this work. There are long articles on the sulphur and soda industries, sixteen pages on stenography, a full account of typewriting machines, and a survey of the most important street railway systems of Europe and the United States. Under this heading we find New York city described as a *Grosstadt* of four and a half million inhabitants counting in "the suburbs Brooklyn, Jersey City, Hoboken, etc." Brooklyn, of course, holds to New York by closer ties than the cities across the Hudson, whose people do not count in the four and a half millions. Under "Staten Island," we are told of Fort "Wadson," presumahly Wadsworth. The volume is exceptionally rich in colored plates, of which two go with Protective Coloration (*Schutzeinrichtungen*). The history of Sweden is hrought down to 1908.

Karl Knortz, the German-American educator, who by numerous books and pamphlets has interpreted American writers to Germany, is the author of a little book, "Der Pessimismus in der amerikanischen Literatur" (Vienna: Lumen Verlag).

Interest in Jean Paul produces at intervals some new interpretation of his personality and work. The latest attempt in German is "Jean Pauls Æsthetik," by Dr. Eduard Berend. It is a book of nearly 300 pages in Dr. Franz Muncker's series, Forschungen zur neueren Literaturgeschichte (Berlin: Alexander Duncker).

Among the many replies provoked by Prof. Ernst Haeckel's "Welträtsel" and the propaganda of religious monism, one of the most interesting is the recent work of J. Hauri, "Die Welträtsel und ihre Lösung" (Berlin: C. Skopnik). The book consists of a series of semi-popular lectures, following closely the topics discussed by Haeckel. Hauri develops a *Weltanschauung* from the point of view of a Christian idealism. The work will be of service in acquainting the reader with the leading philosophical and religious problems of the times.

Whoever has tried to wade through the 1,600 pages of letters and memoranda attributed to the wife of Schiller, and edited by E. Urlichs, at Stuttgart, 1860-65, will appreciate the service just rendered by Ludwig Geiger in selecting only the most important of these documents and publishing them (Berlin: Hans Bondy), in one handy volume, entitled "Charlotte von Schiller und ihre Freunde." Geiger has taken only the most readable material and arranged it to illustrate Charlotte's youth and married life, Schiller's death, Goethe, and Charlotte's widowhood; and he has add-

ed literary notes. There is a lengthy introduction giving a vivid and sympathetic sketch of Charlotte and her famous husband at Weimar, and a good index.

"Kultur und Erziehung: Vermischte Betractungen," by Wilhelm Minch (Munich: C. H. Beck'sche Verlagsbuchhandlung), is a volume of essays by the author of an earlier collection of "Vermischte Aufsätze." Herr Minch raises questions of interest to English and American, as well as to German, schoolmasters. He discusses the value of travel, points out the difference between knowledge and education, and the changes in educational ideals. The fault that he finds with the more celebrated schools of England is that they serve but a limited number, and that their courses hold too closely to the civilization of the Greeks, the Romans, and the English. The result is that even persons of the upper circles, while travelling widely and knowing the round earth very well, usually have but a limited knowledge of the world of intellect, and correspondingly limited and preconceived views of life. In sport, of course, the English excel the Germans, both in enthusiasm and participation; but sport will not make up for all other deficiencies. It is a question, for example, whether, as suggested by Wellington, English victories in war have been due mainly to exercise and development in English sport; the Germans have won a few victories also, while never enjoying such aristocratic facilities for play as are found at the English universities and colleges. Herr Minch does not accept the results thus far attained in America in coeducation as conclusive proof that the problem has been solved here. On the contrary, he sees several reasons for still separating boys and girls, at least during certain years. He argues that the physical and mental equipment of the two sexes is not the same, that revision of courses designed for one sex is frequently necessary if the other sex be admitted, and that in this age of specialization it is more or less a contradiction to generalize by offering equal curricula. Nevertheless, American influence has made itself felt somewhat in lower classes of the German schools, where, for some time, boys and girls have been taught together.

Dr. Rudolf Unger, in his "Philosophische Probleme in der neueren Literaturwissenschaft" (Munich: Spiegelverlag), unfolds a new programme for the modern study of literature, urging that the exclusively philological method which has prevailed at the universities, and which alone has been recognized as scientific, should be at least supplemented by a method which emphasizes leading tendencies in the literary world, and their bearings on the personality and thought of an author.

Mrs. Augusta Jane Evans Wilson, the author, died Sunday from heart disease, at her home in Mobile. She was born at Columbus, O., in 1838, and in 1868 was married to Col. L. M. Wilson, a well-known banker of Mobile. In 1856 she had produced her first book, "Inez." This was followed by "A Tale of the Alamo," "Beulah," "Macaria," "St. Elmo," "Vashti," "Infelice," "At the Mercy of Tiberius," and "A Speckled Bird." Her last production was "Devota," published in 1907.

The Rev. Dr. Henry Randall Waite died May 6, at the age of sixty-two. After a course in Hamilton College, Dr. Waite became a member of the staff of the Utica *Morning Herald* Poor health compelled him to travel, and he went to Italy in 1871, where he founded the Italian Young Men's Christian Association in Rome. Soon after his return from Italy Dr. Waite was ordained a minister in the Congregational Church. Civics occupied much of his attention, and while editing the *American Magazine of Civics* he lectured frequently on the subject. He also occupied places on the directorates of many financial concerns.

Dr. Benjamin Bausman, one of the most widely known ministers of the Reformed Church in the United States, who was pastor of St. Paul's Reformed Church of New York, died May 8, at the age of eighty-five. Dr. Bausman was a trustee of Franklin and Marshall College; was president of the board of managers of Bethany Orphans' Home, and for many years edited various Reformed Church papers. His published works include "Sinai and Zion" (1860), "Wayside Gleanings in Europe" (1878), "Bible Characters" (1893), and "Precept and Practice" (1901).

The death is reported in his seventy-fifth year of Dr. Marcus Dods, principal of the United Free Church College, Edinburgh, since 1907. He contributed articles on religious subjects to "The Encyclopædia Britannica" and to various periodicals. His works include: "The Prayer that Teaches to Pray," "The Epistles to the Seven Churches," "Israel's Iron Age," "Mohammed, Buddha, and Christ," "Handbook on Haggai, Zechariah, and Malachi," "Isaac, Jacob and Joseph," "Handbook on Genesis," "Commentary on Thessalonians, "Parables of Our Lord," "Why be Religious?" "How to Become like Christ," and "The Bible, Its Origin and Nature."

IRELAND AND THE COLONIES UNDER THE STUARTS.

Ireland Under the Stuarts and During the Interregnum. By Richard Bagwell. 2 vols. New York: Longmans, Green, & Co. $10.50.

After three hundred years of controversy, the history of Ireland, especially during the sixteenth and seventeenth centuries, has begun to come to its own in the hands of scientific historians. It is a result for which we may well be thankful. Stripped of passion and prejudice, the account of the English conquest and colonization is one of the most important and instructive in the modern field. Interesting in itself, it has additional interest in that it is a part of the history of England, and is related to the history of America. It is a grim and terrible story which, more than twenty-five years ago, Mr. Bagwell set himself to tell. In three earlier volumes, "Ireland Under the Tudors" (1885-1890), he recounted the beginnings of the English occupation, and carried the narrative through the reign of Elizabeth. In the present work, he takes up two more chapters, the exploitation under James I and Charles I, the rebellion and subjugation of the Irish under Charles I and Cromwell, ending with the Restoration.

Only by plantation did the English conceive that, after the rebellion of the earls, they could make a "civil people" of their subjects, and secure the substantial fruits of their occupation. During the first half of the seventeenth century, in consequence, that process went on beside the plantation of America, and, with allowance for differing conditions, by not dissimilar means, until the troubles at home interrupted the movement. Then came the reaping of the whirlwind in the rebellion of 1641, and the long, cruel, and confused contest, which ran parallel with the civil wars in England. Affected strongly by them, and influencing English affairs no less powerfully in turn, the Irish struggle threatened, at times, to wrest control of the island from King and Parliament alike. Complicated as affairs were by an almost incomprehensible confusion of interests, royal, parliamentary, native Irish and settler, Papal and Continental, not until the stern discipline of parliamentary forces found foothold in Ireland did order begin to emerge from chaos. The policy of Thorough may have been the only solution of the difficulty, but it was enforced at a great price. Before those parliamentary columns, the Irish confederacy, the gallantry of Ormond, and the silent courage of O'Neill, the disunited opposition of lesser chiefs, the resistance of the cities, the guerrilla activities of the broken bands, one by one were beaten down. From Dublin around the coast to Galway, the Cromwellians slowly and irresistibly crushed out all opposition and completed the conquest of the island beyond all power of the natives to throw it off. It was the triumph of organization and union over their opposites, the victory of a nation over tribes, of an early modern civilization over one still largely early mediæval. Thereafter came the expulsion of those who had taken part in the rebellion, from the lands east of the Shannon, and the entry of the Commonwealth adventurers to take their place beside the older English and Scotch settlers. In that fifty years, the line of English landlordism was pushed across the island, and the foundations of modern Irish conditions and history, and no little English history and politics beside, laid in conquest and confiscation. This is the tale that fills these pages.

There is scarcely any similar period or movement which has been the subject of more bitter controversy and recrimination. The English conquest of Ireland was, in many ways, not unlike the Norman conquest of Great Britain five centuries earlier. It differs, of

course, in details, and in the large matter of transplanting the conquered landholders. But it differs still more in that it took place in the brighter light of modern times, and in that the defeated race, numerous, able, aggressive, and largely irreconcilable, still resents and resists. Had the English been Catholics, or the Irish Protestants, political, social, and economic antagonisms might not have been embittered beyond compromise. Had the tribal chiefs been more enlightened and less selfish, they might have made more effectual resistance. Had the people been less loyal to their leaders, the whole issue might have been otherwise. Yet to state the condition is merely to sum up the result. Divided from England as Ireland is by the sea and by so many causes of dispute, reconciliation, much less assimilation, seems as distant as ever.

Here, then, is delicate ground not merely for the politician, but for the historian, and no one realizes this more keenly than Mr. Bagwell himself. "No party," he says truly in his preface, "will be pleased with the present work." Yet in those words lies the book's greatest value. With what may be called the moral issues, the adjudication of right and wrong, which to so many means merely rights and wrongs, with the distribution of praise and blame, he has little concern. In so far as possible he has allowed the actors to reveal themselves in their own words and deeds, himself refraining from controversy, almost from comment. He adduces the evidence. Whatever judgments the reader passes must be his own, whatever quarrel he has must be with the facts. There are no purple patches in the narrative, however many there may be in the deeds recorded. The story is restrained often almost to the impersonal colorlessness of a chronicle. The account is developed by piling detail on detail. In the main, this is enough to give interest and direction. In the case of Wentworth's government, for instance, the result is vivid and convincing. But in the confusion of the later wars one sometimes longs for more guidance.

The critical apparatus is full, and, since a large part of the material upon which Mr. Bagwell's study is based is to be found in print, or in easily accessible manuscripts, one may, without great difficulty, test the accuracy of his statements. In the most disputed part of his period, that of the Rebellion of 1641, he follows and amplifies Miss Hickson's work, as against its assailants, like Mr. Dunlop. In short, it can no longer be said with truth that there is no adequate and scholarly history of Ireland during this period. One may regret the absence of certain maps which would be useful to the reader, and the inadequacies of the indexes; one may note certain obscurities or omissions in the text; one may wonder at the lack of reference to the work of Continental scholars; yet, when all is said, Mr. Bagwell has enriched the history of Ireland and historical literature generally, and one may well echo his expressed hope that he may be spared to finish his study of the final settlement between the Restoration and Revolution.

Acts of the Privy Council of England. Colonial Series. Vol. I; 1613-1680. Edited by W. L. Grant and James Munro, under the general supervision of Almeric W. FitzRoy, Clerk of the Privy Council. London: Wyman & Sons.

Among the publications of the British government few are likely to be of greater importance for colonial history than the projected series of "Acts of the Privy Council, Colonial," the first volume of which is now issued. When completed, in five volumes, bringing the subject to 1783, the work will take its place beside the Calendars of State Papers and Reports of the Historical Manuscripts Commission as an essential part of the student's equipment. It will not furnish any great amount of new information regarding the internal history of the colonies, but it will give a point of view and a survey of policy that have never before been attained. During our colonial history executive control was in the hands of the King, his ministers, and advisers. The nature of this control can be learned only from the records of the organs that exercised it, viz., the Privy Council, the Secretaries of State, the Commissioners of the Treasury, and the Commissioners of the Admiralty. Though it might have seemed desirable in the past to know something of these organs and their work, the fact remains that such knowledge has not been possessed by those who have written on colonial history. This neglect may be attributed in part to indifference and in part to the fact that the material has been remote and to a certain extent inaccessible, much of it lying intermixed with other data, partly or wholly irrelevant.

The Calendar of the Acts of the Privy Council, edited by Mr. Dasent, closes with 1603, and the British government has decided not to continue it. We are indebted to Mr. FitzRoy for the plan of carrying on the work along colonial lines. Knowing that the records of his office after 1603 were more important for colonial than for domestic or foreign affairs, he obtained the consent of the Treasury to issue a series of volumes containing pertinent portions of the Register. Since the Treasury was unwilling to meet more than the expenses of printing and binding, the cost of transcribing and editing had to be defrayed through public and private agencies in England, Scotland, Canada, and America. Thus the work has somewhat the character of an international undertaking. The labor involved may be inferred from the fact that the original Privy Council Register for the years 1613 to 1783 consists of a hundred large folio volumes, often difficult to handle even with an index.

A scrutiny of this first volume leaves a favorable impression of the scope and variety of the work of the Council, and of the amount of time devoted by men of distinction to the difficult task of solving colonial problems. Even Charles II, usually characterized as indolent and prone to shirk business, appears in a new light. He was unfailing in attendance and deeply interested in these affairs. Though there are no entries here that show the part he took in discussion, yet the fact that he corrected with his own hand letters sent to the Governors would indicate that he was more than a passive listener.

The King and his Councillors had but one idea before them: to promote the welfare of all colonial and commercial undertakings. They encouraged settlement, watched the growth of the plantations, and sought to stimulate the production of whatever would be of value to colonies and mother country alike. They settled disputes, adjudicated private claims, and gave relief. Throughout the period here covered the Councillors invariably acted as honorable men, always hearing fairly and justly both sides of a case, consulting outside boards and individuals, and finding in the end the best remedy that they could. That they were influenced by the accepted doctrines of the period, in controlling colonial industry and commerce and placing definite restrictions upon freedom of movement and trade, is no cause for criticism. They were but adopting a policy advocated by all statesmen of the time and deemed fundamentally important in view of the intense commercial rivalry existing among the maritime states of Europe. England and its incorporated companies must be protected against aliens and private traders, colonial products must be brought to the mother country, and the oaths of allegiance and supremacy must be taken. Yet, where possible, rules were relaxed and exceptions made in the interest of colonial trade and the plantations, and in not a few instances the Council deemed colonial welfare of greater consequence than the welfare of the people at home. Even the principles of the Navigation Acts, which can be studied here in their development, were certainly not in the beginning antagonistic to colonial prosperity, and the acts themselves are seen to be rather a culmination than a cause. From the point of view of modern trade conditions we may feel inclined to find fault with some of the premises, but from the point of view of the seventeenth century the Englishman would

have had the better of the argument. He was working to make England, and not the colonies, independent, and as far as that end was sought he was amply justified in the results.

In two or three years all the data will be in the hands of students. We may not anticipate the final judgment, but we believe that the printing of these records will distinctly enhance the reputation of the Council as a governing body for the colonies.

CURRENT FICTION.

The Inner Shrine. New York: Harper & Bros.

Anonymity is a card which may be played with considerable effect by the modern editor or publisher, since our present habit of publicity insures against its being played too often. As a serial in *Harper's*, "The Inner Shrine" has reaped a harvest of curiosity somewhat out of proportion to the actual merit of the performance. "Who wrote it?" is a question of such burning importance to us that we incline to lose sight of the comparatively tame question, "What does it amount to?" It must be said that the commercial or editorial sponsor commonly does what he can to encourage us in this weakness: he is but human, and he likes his commodities to "go." For example, Harper & Bros. have taken the trouble to affix to advance copies of the present novel, for the eye of the hardened reviewer only, numerous speculations as to its authorship. A lady from California guesses Mrs. Humphry Ward, whereupon the authorities magnanimously admit in black type that Mrs. Ward is NOT the author. Heavily leaded, too, is the passage from that eminent critic, the Boston correspondent of the New Orleans *Times-Democrat:* "It is quite on the cards that in the early years of the twentieth century we have seen the dawn of a new novelist of unquestioned power. . . . Is it Mrs. ———?" and so on.

As a matter of fact, "The Inner Shrine" is by no means worth all this pother. It is a cleverly constructed bit of popular fiction, and no more. Its style, in a superficial sense, suggests an amalgam of Mrs. Ward and Mrs. Wharton: it has the trick of the sophisticated school. Essentially, it is a rather vulgar story of a group of persons, none of whom is free from one or other sort of pusillanimity. The flavor is Franco-American: scandal and the fear of scandal are the chief motives of the composition. A Frenchman traduces a Frenchwoman, and is called out by her American (Parisian-American) husband, who commits suicide under cover of the duel. She has been a heartless coquette, though not technically a guilty woman. She comes to America, and is on the way to a second marriage when the old lie pursues her. Her lover, an aristocratic New Yorker of crude perceptions and boorish manner, accepts the slander without question, and casts her off. She is all meekness, rather admires him, Jane-Eyre-like, for his stupid brutality, and, of course, marries him in the end—after the French villain has been put through the necessary paces, and the American Rochester has remembered to say that word without which no woman in fiction is content to be won. If the free gift and placid reception of insult, base suspicion and slavish fear of one's own set, the manners and morals imputed by gossip-mongering journals, really characterize our best cosmopolitan society, how shall these traits be palatably set forth in fiction unless with the aid of a certain superficial fastidiousness? There are interesting situations in this story, there are even brilliant bits of dialogue, but there is little in its actual content, whether of incident or interpretation, to arouse anything approaching emotion in the reader who looks upon fiction as a responsible art.

Little People. By Richard Whiteing. New York: Cassell & Co.

Like "A Poor Man's House," (see the *Nation* of April 15, p. 387), "Little People" is upon the border-line between fiction, and sociological speculation. Mr. Whiteing's Little People are the poor in spirit, the obscure, the unsuccessful, the inarticulate who chiefly inhabit this world. He approaches this order, not in a spirit of pity or condescension, but with respect and even a kind of envy. Many of them do not succeed, are not "heard of in the papers," because they are not ruthless enough, or because they are ruled by a natural instinct of quietism. It is the "Ratepayer," who succeeds—which is Mr. Whiteing's term for the Philistine, the "practical" man. A particular Ratepayer figures a good deal in these papers—a person with whom the writer represents himself as having grown up, and whose career he traces fragmentarily as an awful example of what the normal idealism of childhood may come to in process of what we call breeding and education. A number of sketches, not quite stories, adorn the casual discourse—episodes in the lives of various "Little Peoplers," which would not be chosen by the ordinary story-teller as especially promising, but which give point to this tribute to modest and contented ineffectiveness. Several of them are ironical, like the story of the youth who (from philanthropic motives) wishes to get himself sent to a mad-house. He tries various eccentric and outlandish behaviors in vain, but succeeds as soon as it occurs to him that the way to antagonize society is to act reasonably. There is the incident, too, of the poor old drudge who is killed by having to undergo a fashionable rest-cure. But it is all very good-natured. If there is anything for which the writer feels contempt, it is the stupid self-absorption of the Ratepayer, whom success has taught to believe "in nothing but the right to do as he likes in everything, with lawyer, doctor, and parson to stand by and save him from the worst." On the other hand, if there is any class which he admires, it is what may be called the aristocracy among the Little People—those among the naturally capable who prefer the life of quiet independence. "This is the true Bohemianism, and the only kind that counts, with liberty, not license, for its end and aim. The Bohemianism of the pot-house is a dead thing: it was hindrance and enslavement, and it had to go. . . . Freedom for the finer impulses, that is the thing: and of all these, grossness is the enemy. So also is the cut and dried." If this is not a great book, it is an unusually attractive one by reason of its unaffected gentleness and optimism.

Hilary Thornton. By Hubert Wales. Boston: Dana Estes & Co.

One lays down this book with a sense of distaste, despite its manifestly high ethical intent. It seems to represent the inherent unwholesomeness of modern introspection, focussed upon the unpleasant possibilities of marriage; it is a congress of Horrible Examples. Not one of its uncomfortable men and "virile" woman (save the mark!) but makes shipwreck of life matrimonially. There is an unpleasant insistence upon the physical, interlarded with wearisome strata of speculative philosophy; on the whole, it seems one of those unfortunate but unavoidable expressions of the morbid moments that punctuate the growth of the race as of the individual organism. It is comforting to realize that such states are essentially abnormal, and that despite the outcries of the overstrained nerves of society, sanity and poise continue to hold sway at the heart of things.

The Glory of the Conquered. By Susan Glaspell. New York: Frederick A. Stokes Co.

This "Story of a Great Love" reminds one that all magnitude is relative, and that every man may whittle his own measuring-stick. Ernestine, who paints very well, marries a famous young bacteriologist, Karl Hubers. They idle away eighteen months honeymooning in Europe—a curious thing for a scientist to do, who is supposed to be on the verge of a great discovery—and then join the faculty of the University of Chicago. After bitter misfortune, Karl dies and Ernestine, who had given up her painting to help him in his investigations, picks up her brush again,

producing a portrait of the departed which critics praise highly—and there's the end. Now, if this is a great love, every hamlet knows greater ones. Ernestine had sacrificed only her art work, a mean thing beside the good name, well-being, and honor which many a woman has given up for another's sake. And there is no visible reason why she should have altogether abandoned even that. Only when measured by its emotional intensity can her love be called great; in this dimension it is truly gigantic. Kisses crackle interminably, the air is murmurous with plaints, and freshets of tears descend whenever anybody looks into anybody else's eyes, or the cook burns Karl's flapjacks. Whoever can appreciate this point of view will find the story well told, even excellently told at times; and possibly be so captivated by its lachrymose lights and shadows that she will even overlook the utter superfluity of Georgia, Joe Tank, and some other characters.

As Others See Us: A Study of Progress in the United States. By John Graham Brooks. The Macmillan Co. $1.75 net.

Mr. Brooks has had the happy thought to collect and classify the opinions of the United States and its people expressed by European travellers during the last hundred years, as a basis for some interesting reflections on the progress of American society. Irritating and humiliating, often, as were the observations of Mrs. Trollope, Harriet Martineau, Dickens, and others, they afford at this distance a good deal of aid in understanding the social life of the time, in determining wherein we did differ from the accepted standards of Europe, particularly England, and in measuring the distance which we have traversed since the "period of the newness." And what was said by these better known and more widely read critics was repeated, with slight change of manner or emphasis, by the scores of less distinguished writers who found us interesting enough to visit and describe.

One cannot but be struck by the constant iteration, during the first half of the nineteenth century, of certain damning counts in the dreary indictment. That our roads were bad and our inns intolerable; that our cooking was a menace to health and our table manners extraordinary; that the American voice, particularly with women, was an instrument of torture never to be forgotten by one who had suffered it; that we were a nation of braggarts and claimed a monopoly of wit and humor; that our scenery was overrated, our culture crude and provincial, the good elements in our society a weak imitation of Europe, our politics hopelessly corrupt, our newspapers impossible, and democracy itself a more than doubtful experiment—such were the depressing conclusions which well-nigh every visitor felt compelled to draw after never so brief an acquaintance, if, indeed, he had not already drawn them before starting on his trying and hazardous journey. Mr. Brooks, who surveys the catalogue of national sins and shortcomings with imperturbable good humor, does not deny that American society has often been vulnerable; but the marshalling of extracts in the pages of his interesting volume is of itself sufficient to show the grotesqueness of much that otherwise sensible people said about us. After the civil war, however, he notes a change. Our achievement in preventing a disruption of the Union and then in restoring peace, and especially the return of the army to civil life and the payment of the war debt, made a profound impression abroad; and those who hitherto had thought our future more than doubtful began to take a new interest in us, and to study us with something more suggestive of intelligence and open-mindedness. The "American voice," to be sure, is still to be dreaded, and our houses are prevailingly over-heated; but comments of this sort, joined to the inevitable descriptions of Niagara and the West, give place more and more to discussions of our progress in education and public spirit, of the better workings of party politics, and of such national problems as the negro and the trusts. Here, naturally, Mr. Brooks is on more familiar ground, though his comments on some of these recent observers, especially Mr. Bryce and Professor Münsterberg, are not the least interesting of his pages.

Mr. Brooks is so frankly an optimist, so skilful in confronting the hostile or doubting critic with facts that have been overlooked, and withal possesses so wide a range of social observation, that one rises from a perusal of this volume with a heightened sense of our national soundness and a more cheerful confidence in our national future. If he errs at all, it is in the direction of ever-friendliness, but every student who is familiar with the books which Mr. Brooks cites must admit that the provocation is great. The volume is one that should be widely read if for no other reason than that it is delightful reading.

An Introduction to the Study of Comparative Religion. By Frank Byron Jevons. [The Hartford-Lamson Lectures on the Religions of the World.] Pp. xxv+283. New York: The Macmillan Co. $1.50 net.

The Hartford-Lamson Lectures of the Hartford Theological Seminary are designed to give students intending to be foreign missionaries a knowledge of the religious customs and ideas of the peoples to whom they are to go. This is the first foundation of the sort in this country; the purpose is excellent, and the selection of Dr. Jevons as the first lecturer was a happy one—he is well known as an able writer on early religion. His attitude in these lectures toward non-Christian religions is catholic: he urges students to recognize what is good in every religion, and to show the superiority and finality of Christianity by pointing out that it gives in perfect form the conceptions that in other faiths are imperfect. The subjects he treats are immortality, magic, fetishism, prayer, sacrifice, morality, Christianity, all of which he discusses with freshness and felicity of exposition.

He has dealt with these subjects in former works, and here repeats views expressed by him elsewhere. In several cases he appears to lay undue stress on logical definitions, and his statements are not always self-consistent. Religion he defines as "the worship of the gods of a community by the community for the good of the community," and he accordingly denies that fetishism is religion, on the ground that it is an individual, selfish, anti-social cult. But this definition is arbitrary and narrow—it is based on a certain form of religious worship, and ignores other well-established forms. If religion is a practical relation between man and superhuman powers, then fetishism is a religion. The demand of the fetish-worshipper, though generally for harm to his enemies, is not always of this character; and when it is so, it is not less religious than a psalmist's prayer for the destruction of a personal foe. Obviously in any religion an individual may put up individual petitions, "but," Dr. Jevons adds, "we may safely infer that the only prayers that the god of the community is expected to hearken to are prayers that are consistent with the interests and welfare of the community." This is by no means the case—a man does not always think of the community when he prays, and he will not pray unless he expects the gods to hear his prayer and answer it favorably. In like manner Jevons rules out magic. The much-discussed question of the relation between magic and religion cannot be gone into here; it is a question of definition, but we know that magical procedures have sometimes been approved and adopted by the established religion of a community. In regard to the origin of sacrifice, Robertson Smith's theory (to which there are serious objections) that it was a sacramental eating of sacred (that is, divine) flesh, whereby the worshipper secured communion with the deity and forgiveness of sin, is here expounded. Dr. Jevons, however, extends the meaning of "sacrifice" so as to include worship; Christian sacrifice, he

says, is holy living: "that is the sacrifice Christ showed us the example of; that is the example which the missionary devotes himself to follow and to teach."

The recent discussions of Höffding, Hobhouse, and Westermarck, in which morality is declared to be independent of religion, are vigorously criticised by Dr. Jevons. Justice, he rightly says, is a social matter, and an offence against the custom of the community is an offence against the law of the god who is the guardian of the rights of the community. On this point there seems to be no necessity for debate; the disputants on both sides will, probably, agree that men's ethical codes are derived from social intercourse, that the code of a god is always that of his circle of worshippers, and that the god, as superhuman chieftain, enforces this code —that, in a word, religion and morality, though distinct in origin, are always united in human life; the gods, like men, are never without their ethical codes, and so religion may be expected to support and stimulate morality. If God is the moral ideal, the love of God is devotion to this ideal, and thus Dr. Jevons's conclusion—that the love of God is the basis and end of society—finds its justification.

The Greatness and Decline of Rome. Volume V. The Republic of Augustus. By Guglielmo Ferrero; translated by the Rev. H. J. Chaytor. New York: G. P. Putnam's Sons. $2.50.

In his initial volume, Signor Ferrero explicitly stated his intention "to continue the narrative down to the break-up of the Empire." But with no explanation whatever, the author has forsaken his task when hardly past the threshold, for he introduces the present volume with the statement that it "completes my study of the 'Greatness and Decline of Rome.'" Under the circumstances, the title should have been altered to suit the fact, since not even the first part of its promise has been fulfilled, to say nothing of the second.

The author has a method of expression more widely attractive than is usually attained by writers in this field, as was evidenced by the newspaper publicity given to his recent lectures at Harvard, Columbia, and the University of Chicago. The rumors, however, that this brilliant sally would prove to have rendered obsolete the patient lifetime labors of earlier scholars on the same ground have never gained credence with those who have given much careful attention to the subject. We say "brilliant sally," for patient and exhaustive historical investigation in the field of ancient history is not the task for which the author's activities in the past would furnish a suitable equipment, and the readiness with which he has turned back after putting his hand to the plough may well indicate that the field is not congenial to his tastes. The work is continually suggestive of an overpowering belief on the author's part that Roman history *must* have illustrated certain principles of social development assumed to be active in all races and all times. Within certain limits, this is true enough, but those limits are easily passed. For instance, the principle that "the average of mankind, under average conditions, are neither particularly good nor particularly bad," is rather heavily strained when it is called in to discredit such evidence of Julia's enormities of unchastity as the public revelations by which Augustus himself justified the severity of her punishment. As it happened, Julia was neither of the average of mankind, nor under average conditions, and so with native qualities which should have made her particularly good in various lines of praiseworthy effort, she did become particularly bad under the untoward conditions forced upon her. Julia's fortunes were, perhaps, of less importance to Roman history in general than the space given to them by the author would indicate. We cite the matter only as one illustration of an unsafe dependence upon theoretical assumptions, which must be regarded as seriously affecting the trustworthiness of Ferrero's work at many points. Again and again he himself feels the want of any valid documentary support for direct statements made in the text, and admits the situation in a footnote, only to build upon this rickety foundation in subsequent paragraphs as if it were of unquestioned solidity. For example, the assertion on page 272 that Augustus "showed his hatred of Tiberius on every occasion" is admitted in a footnote to be merely a supposedly necessary inference of hatred from the fact that the failure of Augustus to recall Tiberius from his semi-exile at Rhodes was contrary to the public interest; but this sweeping inference is followed later, first by the statement that Augustus had for him "nothing but sullen hatred," and again that "his animosity had grown more bitter with age."

As to Augustus himself, the main thesis of the book is that the government of Rome under Augustus was thoroughly *republican*, not monarchical at all, and that as a matter of fact he had no intention whatever of trying to establish a monarchy. So far from wanting to nullify the Senate as an effective part of the governmental machinery, he devoted a large portion of his energies during the greater part of the successive terms for which he was chosen as "President" (be careful not to speak of his reign) to one desperate effort after another to restore that body to its former prestige and responsibility. In his oft-reiterated insistence on these points, the author hardly seems to realize that he is not breaking new ground, just as he does not realize that he is not original in his attention to the economic factor in his work as a whole. If there is anything new, as compared with the work of various others, it is rather in the extreme to which these points are pushed, and we can only say that these extremes are not adequately supported. The terms republic and monarchy are, of course, extremely elastic. Augustus was at no time a monarch if the word be pressed to the point of complete absolutism; but to convey the idea that he was the freely chosen "President" of a republic of the same fundamental type as that of the United States is to go still farther from the truth toward the opposite extreme; and that is just what Signor Ferrero does in the text of this closing volume, and briefly in the preface to the new American edition of Vol. I, where his American readers are flattered with the statement that they are better able to understand Roman history than European readers because of this basic similarity. The application of ancient experience to modern problems is, of course, one of the most useful features of historical study, but it is just the point at which the careful teacher must exercise the most rigid control of his assertions and implications. *Quod utinam Ferrerus ipse fecisset*, as Quintilian said of another writer whose brilliancy was more conspicuous than his care.

Socialism in Local Government. By W. G. Towler, with introduction by H. M. Jessel. New York: The Macmillan Co. $1.50 net.

The author of the book is secretary of the London Municipal Society, organized in 1894 to oppose the "Progressive-Socialist" policies of the County Council. By municipal Socialism he means, of course, the "municipalization of local public services," which both the Fabians and the Municipal Society regard as the shortest and easiest road to collectivism. His purpose is to demonstrate that "municipal trading is a failure" and "perilous to the welfare of the nation."

The origin of municipal trading may perhaps be traced to ordinary "business motives" on the part of municipal authorities, but Mr. Towler has no difficulty in showing that many of its latest developments are due to the "quiet work of the administrative Socialist." If doubt could have existed, the utterances of responsible leaders of the progressivists and the vaticinations of irresponsibles, like Bernard Shaw, establish the fact beyond question. The rapid growth of municipal undertakings, reproductive (*i. e.*, commercial) and unreproductive,

is shown by the increase of municipal debts in England and Wales from £164,879,000 in 1884 to £482,983,000 in 1906.

Mr. Towler compares the prices and quality of service under municipal management with those under private, without coming to a very definite conclusion (pp. 94-95), except that consumers may be paying in the form of rates a part of the cost of some branches of service, and that since the municipalities do not yet have the field to themselves, they feel in some degree the stimulus of competition. This stimulus, however, would be removed if municipalization should ever triumph in all parts of the field. Even as things stand, Mr. Towler finds evidence of unsound business methods, lax administration, and somewhat more actual corruption than is usually supposed to exist. Most serious of all are the holding out of bribes to municipal laborers, and some "deterioration in the character and ability of municipal councillors." Upon all these subjects—as upon the financial aspects of municipalization—there is need of further investigation by some competent authority; and for ten years past, Mr. Towler charges, the effort to secure such investigation has met the "desperate and successful resistance" of the municipal traders. Until such inquiry is had, the financial results of municipal trading cannot be precisely determined.

Partial inquiries, however, have ascertained that municipal accounting is inadequate, that accounts are not uniform, and that the returns do not show the true financial position of the undertakings. The Return of 1903, the most complete available, shows a small surplus (£378,000) upon all municipal industries; but Mr. Towler maintains that this surplus would disappear if certain expenses paid out of rates had been included, a sufficient allowance had been made for depreciation, and the rents or taxes that might have been received from private companies had been taken into account. Municipal traders are divided in opinion concerning the desirability of operating industries at a profit—Bernard Shaw considers such a policy "childish"—but it is tolerably clear that at present the question has merely theoretical interest.

As an alternative policy to municipalization, Mr. Towler proposes public regulation of companies operating under properly guarded franchises. In France and Germany he finds precedents for this policy, as well as in the British Gas Acts; and he regrets that, after the establishment of the Local Government Board in 1871, Parliament did not develop a model franchise policy which would have secured good service at reasonable prices and at the same time offered all necessary inducements to private capital. Certain it is that in this direction, and not in mere criticism of the methods and results of municipal trading, the opponents of municipal Socialism must seek effective weapons.

Egoists: A Book of Supermen. By James Huneker. New York: Charles Scribner's Sons.

It is a little disappointing to compare the brilliant and grandiose vision of the "superman" which haunts the popular imagination with Mr. Huneker's classic representatives of that imposing and preposterous character—the vulgar "little pot-bellied" Stendhal; Flaubert, the "mouther" with the hopeless impediment in his expression; Huysmans, "the Schopenhauer of the cook-shops," with his sublime "tragedy of the gastric juices"; Barrès, Nietzsche, Stirner, Hello—all, or nearly all, gravely defective, marked in one way or another more or less conspicuously with the stamp of ineffectuality. What comfort is to be got out of them at all must be sought in their "egoism," in which at least there are but few and insignificant shortcomings. Indeed, if Mr. Huneker's intention were not of that semi-quizzical sort which delights to baffle conjecture, it would not be unreasonable to suspect a little gentle irony about the lips of his wide and desultory criticism.

But however that may be, his criticism is patently disembarrassed of prejudices. Ibsen he esteems a "lofty thinker, moralist, and satirist." If a subject is only "interesting," its quality is of no particular importance. As long as it is not dull, it may be anything, for all he cares—odd, fantastical, uncanny, morbid, lunatic. "The immortal quartet in nineteenth-century fiction" comprises la duchesse Sanseverina, Madame Marneffe, Emma Bovary, and Anna Karenina. Difference, too, is a kind of distinction. And his favorite authors, if they are not all a little mad, are more than a little "different." They are, each in his own way, "the perfect expression of romantic and anti-social individualism." Naturally, among other lumber, he has rid himself of leading ideas and general principles. His criticism is essentially a criticism of surfaces, intersecting by some critical necromancy in points.

Travelling as he does without baggage, he has great lightness, versatility, and assurance. He is never at a loss, but always ready to alight and be off again in a twinkling. He is not even hampered by the restrictions of composition, for he has none to speak of. He is nothing if not casual. His best things are invariably by the way. Baudelaire was "a poet of ideal, spleen, and music"; Edmond de Goncourt, a "sublime old gossip"; Renan, "a cork soul"; Huysmans, "a Hamlet doubting his digestion." In his passage he sets in circulation a little air of irresponsibility, which is, no doubt, vastly refreshing and exhilarating after the stagnation of serious criticism. His characterization of Hello is excellent in its kind. He frequently draws blood, but he seldom dissects. He never gets to the bottom of anything, never touches the nerve that galvanizes the whole man. His criticism is a kind of fine spray; he atomizes, rather than anatomizes, his author. His subject diffuses in the warmth of his hand into an impalpable vapor, instead of condensing into its more stable elements. You are surprised to find so small a residuum at the end. So of Anatole France:

> An art, ironical, easy, fugitive, divinely untrammelled, divinely artificial, which, like a pure flame, blazes forth in an unclouded heaven . . . *la gaya scienza;* light feet; wit; fire; grace; the dance of the stars; the tremor of southern light; the smooth sea—these Nietzschean phrases might serve as an epigraph for the work of that apostle of innocence and experience, Anatole France.

Such is the *procédé.*

Science.

The Life of a Fossil-Hunter. By Charles H. Sternberg; with an introduction by Henry Fairfield Osborn. [American Nature Series.] New York: Henry Holt & Co. $1.60 net.

Any book for which Professor Osborn of the American Museum of Natural History is willing to stand sponsor by an introduction, is worthy of attention from readers interested in palæontology. One therefore takes up this volume with an expectation of good things that is not disappointed. The vast and unique fossil fields of North America, under the inspiring and directing genius of Profs. E. D. Cope and O. C. Marsh and their able associates and successors, gave birth to a new occupation—that of the professional fossil-hunter. On the honorable list of the devoted pioneers of this new vocation, says Professor Osborn, "is the author of this work, who by his untiring energy has contributed some of the finest specimens which now adorn the shelves and cases of the great museums of America and Europe. . . . His is a career full of adventure, of self-sacrifice, worthy of lasting record and recognition by all lovers of nature." Mr. Sternberg seems to have had a real "calling" to what became his life-work. Even as a boy, he used to cut out shells from the limestone strata of his native region near Otsego Lake, New York. At the age of seventeen, as an emigrant into the opening frontiers of Kansas, he found that the neighboring hills, topped with red sandstone, contained the impressions of fossil leaves like those of our existing forests. He had fallen upon a formation which belongs to the Dakota group of the cretaceous period. Its

sedimentary rocks had been laid down during the close of the "age of reptiles" in a great ocean whose shore lines entered Kansas, and, extending northwesterly to Nebraska and Iowa, passed on to Greenland. This circumstance, recalling the vivid impressions of boyhood, led the youth to determine to make it his business "to collect facts from the crust of the earth, that thus men might learn more of the introduction and succession of life upon the earth."

Thenceforth, young Sternberg collected and prepared fossil leaves with an enthusiasm and inborn skill that has persisted until now. His first collection was sent to Professor Baird of the Smithsonian Institution, who greatly encouraged him. In 1872, a personal interview with the eminent palæobotanist, Dr. Leo Lesquereux, confirmed and directed his pursuit. But it was not until the winter of 1875-76, while a student at Kansas State Agricultural College, that he received the final impulse that launched him upon the career which this book records. An expedition was then and there forming under Professor Marsh for collecting American fossil vertebrates for Yale University. Sternberg vainly applied for a place on this expedition. Then it occurred to him to write Professor Cope of the Academy of Natural Sciences of Philadelphia. The response came promptly, enclosing $300 for an outfit, and bidding him go to work. Thus began a connection that continued for a number of years, indeed, until early death cut short Professor Cope's remarkable career. Among the most entertaining pages in the book are those which cover the author's relations with that distinguished naturalist. Those were the days of the keen rivalry—at times, perhaps, too hotly pressed—between Marsh and Cope. Scarcely more than a trace of this appears in the "Fossil Hunter"; but the fact gives a special interest to the tale of the adventurous, laborious, and expensive methods by which was obtained the wonderful material that fed the high ambitions that fired the scientific contest between these two great captains of palæontology, whose names and works are illustrious in the annals of American naturalists. The incidents related of Professor Cope, especially during an expedition when he personally shared and directed the work afield, are most interesting, particularly to Cope's old friends and associates.

Excursions in search of the fossil remains of the extinct animals of the Kansas Chalk, the Loup Fork beds, the Oregon Desert, the John Day River region, and the Permian of Texas, take up the body of the work. One shares, as one reads, the enthusiasm of the author, in his pursuit of the immense creatures of those eras when our present continent was being formed. As the author has given many plates and cuts of fossil remains, and a number of admirable restorations, one is better able to understand the reason for this enthusiasm. Certainly, when we reflect that a large part of the civilized world is showing a keen interest in our ex-Presidential Nimrod, as he goes to hunt the large game of Africa, it does not seem irrational that we should follow with sympathy and appreciation the story of a hunter of the animal forms which inhabited the ancient world; and which as compared with the vertebrates of our era, were as giants to pygmies, and in structure abounded in the highest significance, as throwing light upon the history of evolution. Moreover, it may be said that, although the author does not pose as an original and scientific investigator, one cannot read his book without getting a good general view of current palæontology, and of many of its chief promoters, both of the present and of the past. The work of the publishers is entitled to approval, not only for clear typography, but for illustrations and general make-up.

The urgent demand in China for Western medical and surgical knowledge has led to the recent completion and publication of an English-Chinese Medical Dictionary under the auspices of the China Medical Missionary Association. It contains 15,000 selected terms. This work has made possible for the first time the translation of the best medical text-books into Chinese. At the recent China Centenary Missionary Conference a resolution was passed requesting the missionary societies to unite in the support of one or two suitable men for the work of translation.

Drama.

A GLEAM OF HOPE FOR THE THEATRE.

It begins to look as if some of the magnates who have acquired the control of most of our theatrical affairs during the last ten or twenty years were becoming conscious of the weak points in their syndicate system and seeking to escape threatened disaster by a reversion, in part at least, to older and sounder methods. Of two facts, patent to all observers, they, as shrewd business men of their kind, must be fully aware. They must know that all actors and actresses of the first rank in this country have practically disappeared without leaving any successors to take their places, and that there is no certain source to which they can look for capable recruits. Such recruits must be found, or nothing can stop that progressive degeneration of the theatre which has already reduced it almost to the level of the music-halls.

Threatened with the total alienation of the more intelligent classes, it is not surprising that an astute manager—suddenly realizing the logical consequences of a policy as fatal to artistic training as it is to vital competition—should be quick to see the significance of the movements on both sides of the Atlantic in favor of the old-time stock-company theatre. These are not only indicative of a widespread discontent with the results of syndicate methods, but are suggestive of a coming rivalry which is not to be lightly disregarded. There was not much to be feared from the sporadic experiments of the various independent organizations which have arisen and subsided, at intervals, here and in London. Most of them were rashly conceived and unwisely conducted. But some of them, notably those of Messrs. Vedrenne and Barker and of Mr. Otho Stuart, were not only rich in actual achievement, but afforded encouraging proof of the financial possibility of a literary, artistic, and intellectual theatre. It was the work of these pioneers that helped to form and develop the public demand that has called the National Shakespearean Memorial Theatre scheme into existence in England—with what ultimate results it remains to be seen—and has now brought about concerted action by a number of influential believers in the theatre for the establishment of a chain of repertory houses, of a high class, in London and the provinces.

The director of the new enterprise is Herbert Trench, a fellow of All Souls, Oxford, himself the author of superior plays and an official long engaged in educational affairs. His plan is to buttress the idealistic drama with plays of a more popular character. In alternation with the play of ideas, he will give revivals of the best modern drama, of Shakespearean pieces, and of the older comedy, together with selected works of famous foreign dramatists, such, for instance, as "The Blue Bird" of Maeterlinck. No plays are to be excluded on account of their character, so long as they are good examples of their special class. The main object will be entertainment upon catholic, but select, lines. The extension of the scheme into the provinces is provided for by the absorption of the Theatrical Organization Society, which has been making the necessary preparations in the principal cities and towns for a considerable period. Influential local committees have been appointed, social and financial backing has been secured, and the whole campaign seems to have been organized upon a substantial and workmanlike basis.

The best laid plans of mice and men are apt to miscarry, and it would be foolish to indulge in premature jubilation; but this scheme really does bear the ap-

pearance of an effective stroke toward the ultimate regeneration of the English-speaking stage. There is at least good ground for hoping that within three or four years there will be half-a-dozen or more repertory theatres, to supplement the missionary work hitherto carried on by Mr. Benson's repertory company and one or two others. That they will continue to multiply as their superior powers of attraction are more generally recognized need not be doubted, and with their increase in numbers will come the needed supply of all-round actors, and, in due time, that honest and healthful competition which is the soul of all artistic inspiration.

With characteristic promptness in following a good lead, Charles Frohman has determined to have his own repertory theatres in London and New York. His scheme is excellent of its kind, but does not necessarily thus far involve any wide departure from his former policy. But his contracts with Granville Barker, John Galsworthy, J. M. Barrie, and Bernard Shaw enable him to sketch an attractive programme, and his bid for good one-act plays ought to bear fruit. Apparently, he has been doing violence to his own convictions all this long while. He acknowledges that there is a public demand—in London, at all events—for the higher drama, and that there are commercial, as well as artistic, objections to the long run. Such utterances coming from his lips have an heretical sound, but his conversion, if sincere and lasting, is a subject not for mockery, but congratulation. He and his allies, with their control of authors, plays, and actors, wield an enormous power for good as well as for mischief, and could, if they chose, establish a chain of repertory theatres which might prove dangerous rivals even to the New Theatre itself. Greater miracles than this have been wrought by the power of the popular will.

The English theatre in Germany is now reported to be an accomplished fact. Engagements have been made and rehearsals have begun. Mme. Meta Illing is the directress. The first performance will be given on May 17 at Wiesbaden, and will form part of the Imperial command dramatic festival given during the German Emperor's visit to that town. The play selected is R. C. Carton's comedy, "Mr. Hopkinson." The cast will include Herbert Waring, Miss Fortescue, Dawson Milward, Miss Ellen O'Malley, Mr. Sothern, and Frank Stanmore. Nigel Playfair is the producer and general stage manager. After playing in Wiesbaden, the company will proceed to Karlsruhe. Darmstadt, and Frankfurt, giving a few performances in each of these towns, including two performances of Mr. Shaw's "Candida."

There is uncommon unanimity among the London critics concerning the general literary and dramatic feebleness of "The Conquest," an adaptation by "George Fleming" from Balzac's "La Duchesse de Langeais," which has just been produced in the London Lyric Theatre by Lewis Waller, with himself and Maxine Elliott in the principal characters. Nothing of Balzac seems to have been left in the piece except the extravagance; and scenes intended to be thrilling provoked innocent laughter.

Music.

Verily, William Ashton Ellis, Wagner's chief apostle in England, is as far superior to all other index makers as his idol is to all other opera composers. Mr. Ellis is apparently devoting his whole life to the translating of Wagner's prose writings and letters into English, and whereas the German volumes have no indexes at all, his versions are always followed by pages that are simply invaluable to those who, without having time to read everything that Wagner wrote, desire information on this or that point relating to his life and works. The latest achievement of Mr. Ellis is a translation of Wagner's letters to his first wife, Minna, which has been published in two volumes (imported by Charles Scribner's Sons). There is an index of no fewer than forty-two columns. One of these columns is taken up with references to Wagner's experiences in London, and the most conspicuous entry (25 references) is under "longs to leave." The references to "Lohengrin" occupy a column, those to "Tristan" another. Minna has three columns, Wagner himself four, subdivided according to topics: abode, acrobatics, age, amnesty, animals ("see also Dogs"), birthday, childless, climbing, conductor, conjugal love (45 entries), courtship, diet, domesticity, dreams, dress, early to bed, excitability, and twenty-five other topics, including health, reading, solitude (68 entries), sensitiveness to noise, walks (61 entries), productivity. Under money matters we read "see Minna, allowance to, *and almost every other page.*" In addition to this illuminating index, Mr. Ellis contributes an introduction of fourteen pages, in which he discusses various points in the tragic conjugal life of Richard and Minna Wagner, the most ill-mated couple that were ever brought together. "My marriage—not a soul knows what I have suffered through that," he wrote to his sister in 1866. Now all the world can read the story. The fact that Minna preserved these letters, containing so many lamentations and reproaches, is noted by Mr. Ellis as one of her good traits:

> It is as though she dimly foresaw the day when herself she might be instrumental in triumphantly clearing her husband's name from calumnies reposing on a false assumption of her "martyrdom."

But why are not her own letters to her husband given to the world, too? Is it because they are not of any literary interest, Minna's mind having been of a purely domestic kind, or are there things in them the Bayreuth folk would rather keep suppressed? Perhaps they will be issued later on; nearly every year sees a new volume of Wagner letters, the latest being collections of those he wrote to the artists who helped him at Bayreuth, and of those received by his mother, sisters, and nieces. These *Familienbriefe* Mr. Ellis promises to translate next if there is a sufficient demand for the letters to Minna to warrant such a step. The letters to Minna need not be further commented on here, as they were reviewed at some length in the *Nation* of May 7, 1908, when the German edition appeared.

Two decades ago it was still customary for expert flute-players to give recitals at which they exhibited their skill. To-day such a recital would not be likely to attract either critics or music-lovers—not, at any rate, in musical centres. The cloying richness of modern orchestral works has made the tone of the flute seem too pallid and monotonous to satisfy the ear for a whole evening. In the orchestra itself, on the other hand, the flute plays a more important part than ever, especially in the scores of Wagner, Tchaikovsky, and Strauss. For this growing importance the flute is largely indebted to the improvements, technical and tonal, made by the Bavarian court musician, Theobald Boehm. In 1871 Boehm published a little book in which he described these improvements and discoursed on the flute and flute-playing in general. He hoped it would be translated into other languages, including English; but this hope has only just been realized. With the consent of Boehm's grandson, Dayton C. Miller has made an English version which he has published in Cincinnati. It contains many useful hints both as regards the execution of florid music (which operatic audiences still dote on) and the expressive playing of sustained melodies.

"Songs Every One Should Know," edited by Clifton Johnson and published by the American Book Co. (Cincinnati), is a collection of two hundred favorite songs for school and home, intended to stimulate a love of good music "by the simple charm of the songs themselves." It is a good collection of its kind, and the songs are divided into groups: national hymns, war songs, ballads, Scotch songs, nature songs, college, minstrel, plantation, religious songs, and others. Coarseness and extreme sentimentality are carefully avoided.

After an absence of ten years, the eminent violinist, Willy Burmester, intends to make an American tour in 1910-11.

Art.

THE ART COLLECTOR: HIS FORTES AND FOIBLES.

Morally considered, the art collector is tainted with the fourth deadly sin; pathologically, he is often afflicted by a degree of mania. His distinguished kinsman, the connoisseur, scorns him as a kind of mercenary, or at best a manner of renegade. I shall never forget the expression with which a great connoisseur—who possesses one of the finest private collections in the Val d'Arno—in speaking of a famous colleague, declared, "Oh, X——! Why, X—— is merely a collector." The implication is, of course, that the one who loves art truly and knows it thoroughly will find full satisfaction in an enjoyment devoid alike of envy or the thought of possession. He is to adore

all beautiful objects with a Platonic fervor to which the idea of acquisition and domestication is repugnant. Before going into this lofty argument, I should perhaps explain the collection of my scornful friend. He would have said: "I see that as I put X—— in his proper place, you look at my pictures and smile. You have rightly divined that they are of some rarity, of a sort, in fact, for which X—— and his kind would sell their immortal souls. But I beg you to note that these pictures and bits of sculpture have been bought not at all for their rarity, nor even for their beauty as such, but simply because of their appropriateness as decorations for this particular villa. They represent not my energy as a collector, nor even my zeal as a connoisseur, but simply my normal activity as a man of taste. In this villa it happens that Italian old masters seem the proper material for decoration. In another house or in another land you might find me employing, again solely for decorative purposes, the prints of Japan, the landscapes of the modern impressionists, the rugs of the East, or the blankets of the Arizona desert. Free me, then, from the reproach implied in that covert leer at my Early Sienese." Yes, we must, I think, exclude from the ranks of the true zealots all who in any plausible fashion utilize the objects of art they buy. Excess, the craving to possess what he apparently does not need, is the mark of your true collector.

Now these visionaries—at least the true ones—honor each other according to the degree of "eye" that each possesses. By "eye" the collector means a faculty of discerning a fine object quickly and instinctively. And, in fact, the trained eye becomes a magically fine instrument. It detects the fractions of a millimetre by which a copy belies its original. In colors it distinguishes nuances that a moderately trained vision will declare non-existent. Nor is the trained collector bound by the evidence of the eye alone. Of certain things he knows the taste or adhesiveness. His ear grasps the true ring of certain potteries, porcelains, or qualities of beaten metal. I know an expert on Japanese pottery who, when a sixth sense tells him that two pots apparently identical come really from different kilns, puts them behind his back and refers the matter from his retina to his finger-tips. Thus alternately challenged and trusted, the eye should become extraordinarily expert. A Florentine collector once saw in a junk-shop a marble head of beautiful workmanship. Ninety-nine amateurs out of a hundred would have said, "What a beautiful copy!" for the same head is exhibited in a famous museum and is reproduced in pasteboard, clay, metal, and stone *ad nauseam*. But this collector gave the apparent copy a second look and a third. He reflected that the example in the museum was itself no original, but a school-piece, and as he gazed the conviction grew that here was the original. Since it was closing time, and the marble heavy, a bargain was struck for the morrow. After an anxious night, this fortunate amateur returned in a cab to bring home what criticism now admits is a superb Desiderio da Settignano. The incident illustrates capitally the combination of keenness and patience that goes to make the collector's eye.

We may divide collectors into those who play the game and those who do not. The wealthy gentleman who gives *carte blanche* to his dealers and agents is merely a spoil-sport. He makes what should be a matter of adroitness simply an issue of brute force. He robs of all delicacy what from the first glow of discovery to actual possession should be a fine transaction. Not only does he lose the real pleasures of the chase, but he raises up a special clan of sycophants to part him and his money. A mere handful of such—amassers, let us say—have demoralized the art market. According to the length of their purses, collectors may also be divided into those who seek and those who are sought. Wisdom lies in making the most of either condition. The seekers unquestionably get more pleasure; the sought achieve the more imposing results. The seekers depend chiefly on their own judgment, buying preferably of those who know less than themselves; the sought depend upon the judgment of those who know more than themselves, and, naturally, must pay for such vicarious expertise. And, rightly, they pay dear. Let no one who buys of a great dealer imagine that he pays simply the cost of an object plus a generous percentage of profit. No, much-sought amateur, you pay the rent of that palace in Bond Street or Fifth Avenue; you pay the salary of the gentlemanly assistant or partner whose time is at your disposal during your too rare visits; you pay the commissions of an army of agents throughout the world; you pay, alas! too often the cost of securing false "sale records" in classic auction rooms; and, finally, it is only too probable that you pay also a heavy secret commission to the disinterested friend who happened to remark there was an uncommonly fine object in Y——'s gallery. By a checrful acquiescence in the suggestions that are daily made to you, you may accumulate old masters as impersonally, as genteelly, let me say, as you do railway bonds. But, of course, under these circumstances you must not expect bargains.

Now, in objects that are out of the fashion—a category including always many of the best things—and if approached in slack times, the great dealers will occasionally afford bargains, but in general the economically minded collector, who is not necessarily the poor one, must intercept his prey before it reaches the capitals. That it makes all the difference from whom and where you buy, let a recent example attest. A year or two ago a fine Giorgionesque portrait was offered to an American amateur by a famous London dealer. At $60,000 the refusal was granted for a few days only, subject to cable response. The photograph was tempting, but the besought amateur, knowing that the authenticity of the average Giorgione is somewhat less certain than, say, the period of the Book of Job, let the opportunity pass. A few months after learning of this incident, I had the pleasure of meeting in Florence an English art critic who expatiated upon the beauty of a Giorgione that he had just acquired at the very reasonable price of $15,000. For particulars he referred me to one of the great dealers of Florence. The portrait, as I already suspected, was the one I had heard of in America. Forty-five thousand dollars represented the difference between buying it of a London rather than a Florentine dealer. Of course, the picture itself had never left Florence at all, the limited refusal and the rest were merely part of the usual comedy played between the great dealer and his client. On the other hand, if the lucky English collector had had the additional good fortune to make his find in an Italian auction-room or at a small dealer's, he would probably have paid little more than $5,000, while the same purchase made of a wholly ignorant dealer or direct from the reduced family who sold this ancestor might have been made for a few hundred francs. With the seekers obviously lie all the mystery and romance of the pursuit. The rest surely need not be envied to the sought. One thinks of Consul J. J. Jarves gradually getting together that little collection of Italian primitives, at New Haven, which, scorned in his lifetime and actually foreclosed for a trifling debt, is now an object of pilgrimage for European amateurs and experts. One recalls the mouse-like activities of the Brothers Dutuit, unearthing here a gorgeous enamel, retrieving there a Rembrandt drawing, fetching out a Gothic ivory from a junkshop. One sighs for those days, and declares that they are forever past. Does not the sage M. Eudel warn us that there are no more finds—"Surtout ne comptez plus sur les trouvailles." Yet only the other day I mildly chid a seeker, him of the Desiderio, for not having one of his rare pictures photographed for the use of students. He smiled and admitted that I was perfectly right, but added pleadingly, "You know a negative costs about twenty francs, and for that one may often get an original." Why, even I who write—but I have promised

that this essay shall not exceed 4,000 words.

For the poor collector, however, the money consideration remains a source of manifold embarrassment, morally and otherwise. How many an enthusiast has justified an extravagant purchase by a flattering prevision of profits accruing to his widow and orphans? Let the recording angel reply. And such hopes are at times justified. There have been instances of men refused by the life insurance companies who have deliberately adopted the alternative of collecting for investment, and have done so successfully. Obviously, such persons fall into the class which the French call charitably the *marchand-amateur*. Note, however, that the merchant comes first. Now, to be a poor yet reasonably successful collector without becoming a *marchand-amateur* requires moral tact and resolution. The seeker of the short purse naturally becomes a sort of expert in prices. As he prowls he sees many fine things which he neither covets nor could afford to keep, but which are offered at prices temptingly below their value in the great shops. The temptation is strong to buy and resell. Naturally, one profitable transaction of this sort leads to another, and soon the amateur is in the attitude of "making the collection pay for itself." The inducement is so insidious that I presume there are rather few persistent collectors not wealthy who are not in a measure dealers. Now, to deal or not to deal might seem purely a matter of social and business expediency. But the issue really lies deeper. The difficulty is that of not letting your left hand know what your right hand does. A morally ambidextrous person may do what he pleases. He keeps the dealer and collector apart, and subject to his will one or the other emerges. The feat is too difficult for average humanity. In nearly every case a prolonged struggle will end in favor of the commercial self. I have followed the course of many collector-dealers, and I know very few instances in which the collection has not averaged down to the level of a shop—a fine shop, perhaps, but still a shop. I blame no man for following the wide road, but I feel more kinship with him who walks scrupulously in the narrow path of strict amateurism. Let me hasten to add that there are times when everybody must sell. Collections must periodically be weeded out; one may be hard up and sell his pictures as another in similar case his horses; artists will naturally draw into their studios beautiful objects which, occasion offering, they properly sell. With these obvious exceptions the line is absolutely sharp. Did you buy a thing to keep? Then you are an amateur, though later your convenience or necessity dictates a sale. Did you buy it to sell? Then you are a dealer.

The safety of the little collector lies in specialization, and there, too, lies his surest satisfaction. To have a well-defined specialty immediately simplifies the quest. There are many places where one need never go. Moreover, where nature has provided fair intelligence, one must die very young in order not to die an expert. As I write I think of D——, one of the last surviving philosophers. Born with the instincts of a man of letters, he declined to give himself to the gentler pursuit until he had made a little competence at the law. As he followed his disinterested course of writing and travel, his enthusiasm centred upon the antiquities of Greece and Rome. In the engraved gems of that time he found a beautiful epitome of his favorite studies. For ten years study and collecting have gone patiently hand in hand. He possesses some fifty classical gems, many of the best Greek period, all rare and interesting from material, subject, or workmanship, and he may have spent a hundred dollars in the process, but I rather doubt it. He knows his subject as well as he loves it. Some day he will write a book on intaglios, and it will be a good one. Meanwhile, if the fancy takes him to visit the site of the Bactrian Empire, he has only to put his collection in his pocket and enjoy it *en route*. I cannot too highly commend his example, and yet his course is too austere for many of us. Has untrammelled curiosity no charms? Would I, for example, forego my casual kakemonos, my ignorantly acquired majolica, some trifling accumulation of Greek coins, that handful of Eastern rugs? Could I prune away certain excrescent minor Whistlers? those bits of ivory cutting from old Italy and Japan? those tarnished Tuscan panels?—in truth, I could and would not. Yet had I stuck to my first love, prints, I should by this time be mentioned respectfully among the initiated, my name would be found in the card-catalogues of the great dealers, my decease would be looked forward to with resignation by my junior colleagues. As it is, after twenty years of collecting, and an expenditure shameful in one of my fiscal estate, I have nothing that even courtesy itself could call a collection. In apology, I may plead only the sting of unchartered curiosity, the adventurous thrill of buying on half or no knowledge, the joy of an instinctive sympathy that, irrespective of boundaries, knows its own when it sees it. And you austerely single-minded amateurs, you experts that surely shall be, I revere if I may not follow you.

We have left dangling from the first paragraph the morally important question, Is collecting merely an habitual contravention of the tenth commandment? Now, I am far from denying that collecting has its pathology, even its criminology, if you will. The mere lust of acquisition may take the ugly form of coveting what one neither loves nor understands. This pit is digged for the rich collector. Poor collectors, on the other hand, have at times forgotten where enterprise ends and kleptomania begins. But these excesses are, after all, rare, and for that matter they are merely those that attach to all exaggerations of legitimate passion. As for the notion that one should love beautiful things without desiring them, it seems to me to lie perilously near a sort of pseudo-Platonism, which, wherever it recurs, is the enemy of life itself. As I write, my eye falls upon a Japanese sword-guard. I have seen it a thousand times, but I never fail to feel the same thrill. Out of the disk of blued steel the artisan has worked the soaring form of a bird with upraised wings. It is indicated in skeleton fashion by bars extraordinarily energetic, yet suavely modulated. There must have been feeling and intelligence in every touch of the chisel and file that wrought it. Could that same object seen occasionally in a museum showcase afford me any comparable pleasure? Is not the education of the eye, like the education of the sentiments, dependent upon stable associations that can be many times repeated? Shall I seem merely covetous because I crave besides the casual and adventurous contact with beauty in the world, a gratification which is sure and ever waiting for me? But let me cite rather a certain collector and man of great affairs, who perforce spends his days in adjusting business interests that extend from the arctic snows to the tropics. His evenings belong generally to his friends, for he possesses in a rare degree the art of companionship. The small hours are his own, and frequently he spends them in painting beautiful copies of his Japanese potteries. It is his homage to the artisans who contrived those strange forms and imagined those gorgeous glazes. In the end he will have a catalogue illustrated from his own designs. Meanwhile, he knows his potteries as the shepherd knows his flock. What casuist will find the heart to deny him so innocent a pleasure? And he merely represents in a very high degree the sort of priestliness that the true collector feels towards his temporary possessions.

And this sense of the high, nay, supreme value of beautiful things, has its evident uses. That the beauty of art has not largely perished from the earth is due chiefly to the collector. He interposes his sensitiveness between the insensibility of the average man and the always exiled thing of beauty. If we have in a fractional measure the art treasures of the past, it has been because the collector has given them asylum. Museums, all manner of overt public activities, derive ultimately from

his initiative. It is he who asserts the continuity of art and illustrates its dignity. The stewardship of art is manifold, but no one has a clearer right to that honorable title. "Private vices, public virtues," I hear a cynical reader murmur. So be it. I am ready to stand with the latitudinarian Mandeville. The view makes for charity. I only plead that he who covets his neighbor's tea-jar—I assume a desirable one, say, in old brown Kioto—shall be judged less harshly than he who covets his neighbor's ox.

FRANK JEWETT MATHER, JR.

We have been somewhat remiss in noticing the successive numbers of the *Burlington Magazine* as they appeared, and must now dispose of three numbers at once: those of the quarter from February 15 to April 15 inclusive. Taking them thus together, one is even more impressed by their purely technical and antiquarian interest than when they appeared. They are almost entirely devoted to delicate points of connoisseurship and the exploration of by-ways of art history and criticism. They not only deal little with contemporary or modern art, but rarely with the great masters, containing only three short articles on "The Early Development of Correggio," the discovery of a so-called Leonardo at Milan, and a possible copy after Giorgione, respectively. For modern art there is an account of some interesting portraits by the English Alfred Stevens, some notes on contemporary portraits in the recent "Fair Women" exhibition, and two articles on the late Charles Conder, whose work, as here reproduced, hardly seems to justify the enthusiasm of Mr. Ricketts. It is only fair to say that Mr. Conder is described as essentially a colorist; therefore his best qualities are probably absent from black and white translation. Art in America is represented only by Oriental pottery and fourteenth century pictures. The magazine is interesting—essential even—to collectors, directors of museums, and the like, but it seems a pity that it should not more often treat in its scholarly manner matter of wider general interest.

Finance.

A QUESTION OF "WHEAT FAMINE."

It appears to be a matter of common agreement, in the grain trade, that the present situation regarding available wheat supplies is one which has rarely arisen in our recent history. The unusual thing is the abnormal price offered and paid for wheat by millers, at localities where it can scarcely be supposed that a speculative corner, in the usual sense at any rate, exists. In its most familiar form, a wheat corner arises from the purchase, by a powerful speculator, of contracts to deliver wheat to him at a stipulated date and in a stipulated market, in quantity greater than the available supply will make possible. Now, the process of cornering the dealers who have contracted for such deliveries will naturally be facilitated to the extent that the corner manipulator gets into his own hands the actual wheat on which the contractors had relied for their deliveries. In a measure, such a condition existed in "May contracts" during Mr. Patten's recent speculations on the Chicago Board of Trade.

But there has been, from the first, one unusual circumstance in the present case. A corner such as has just been described will ordinarily have two results —first, the price of "wheat futures" on the market where the corner exists will be relatively higher than in the country at large, and, secondly, the movement of actual wheat will be in the direction of that market. Now, neither of these exists to-day. Last week's market closed, for instance, with wheat for May delivery selling at $1.27¾ per bushel on the Chicago Board of Trade. This, it is true, was 22 cents a bushel above the price of a year ago. But the actual cash price for wheat on the New York market last Saturday was $1.44, or 33½ cents higher than a year ago. Not only so, but in the heart of the wheat country itself, millers have been paying such prices as $1.40 and $1.50 per bushel, purely for wheat to grind. Chicago dispatches tell us that wheat which was sold from Kansas City to Chicago two weeks ago, has since been resold and re-shipped to Kansas City at an advance of 10 cents or more. Within the present month, a fairly large amount of wheat, stored in New York, was actually sent by steamer to Galveston and thence forwarded by rail to markets in the wheat belt. Whatever may be said of Mr. Patten's recent exploit—and operations to force up the price are certainly no more respectable because there are signs of genuine scarcity—it should be plain that a peculiar and striking situation has arisen in the grain trade at large.

It need not be inferred, from the conditions thus shown to exist in the markets, that we are confronted by anything like exhaustion of wheat supplies. When the trade talks of the farm supply of wheat in Kansas or Nebraska being "used up," the expression is relative. The Agricultural Department's first March estimate of 143,000,000 bushels left on the country's farms from the crop of 1908, is disputed by the trade. The best-known private expert estimated 125,000,000; trade calculations ran as low as 100,000,000. But even if the lowest estimate were accepted, deliveries at market since March 1 have hardly reached 25,000,000 bushels; so that deliveries at the same rate, between now and the July harvest time, would still leave sufficient margin. The stock of wheat in granary in this country is actually some 7,000,000 bushels larger than it was a year ago, although 30,000,000 bushels less than in May, 1907. Europe is worse off for supplies on hand than we are; its storehouses now hold 21,000,000 bushels less than a year ago, and 34,000,000 less than two years ago. But between now and the harvest, it has the Argentine exports to count on—which, though somewhat disappointing in quantity, will probably serve the purpose—or, at a pinch, it may reckon on the habitual makeshift of European consumers, the substitution of rye for wheat flour.

In brief, then, the real problem is not the feeding of the bread-consuming world this season, but to what extent the harvests of 1909 will rectify matters. The world's "visible supply" in the spring-time has been lower on other occasions than it is to-day; in May, 1898, for instance, it got down to 111,223,000 bushels, as against 118,800,000 estimated this month; but an increase of 600,000,000 bushels, or 27 per cent., in the world's yield of wheat that summer—a result largely brought about by the actual needs of consuming markets and by the high price offered in the preceding season—very quickly restored supplies to normal. The tendency, this year, will be the same; the doubtful question necessarily remains whether home and foreign weather will favor the wheat-grower as it did eleven years ago.

The season did not begin altogether favorably, this year; crops even now are not so far advanced as they should be, here or abroad, and this is perhaps the real explanation of the extraordinarily high prices asked for wheat, even on the farms. It must not be forgotten that a speculative period, such as the present time unquestionably is, finds expression not only in high bids by professional speculators for merchandise which they do not own, but in the holding-back of their merchandise for still higher prices by producers who actually possess it. Yet other seasons have started out with as indifferent promise as has 1909, and ended brilliantly. The next month or two will settle the question. Until then, it would be premature to discuss the results of another deficient harvest, coming on the present singular position of supplies. That it would be a calamity, no one is likely to deny; fortunately, it is a far less probable calamity, with the world-wide extension of area under wheat culture during the decade past, than it has been at any previous time.

Ready This Week.

Alice Duer Miller's Less Than Kin

By the author of "A Modern Obstacle," etc. $1.25.

Amusing and clever. A clean-cut young fellow from South America is welcomed as a prodigal son into an exclusive New York family of entire strangers.

L. G. McPherson's Railroad Freight Rates

In relation to the Industry and Commerce of the United States.

By the Lecturer on Transportation in Johns Hopkins University, and author of "The Working of the Railroads." With Maps, Tables, and full index. $2.25 *net*, by mail $2.42.

The result of a first hand survey covering the entire country.

"An exceedingly important book. . . . Not only the best existing account, but it is easily the best book on American railway traffic. We have little hesitation in expressing the opinion that it will stand as the standard reference work for a good many years." —*Railroad Age Gazette.*

ANNOUNCEMENT

The INTERPRETER'S COMMENTARY

ON THE

NEW TESTAMENT, Vol. VI.

PAUL'S EPISTLES TO THE

Corinthians and Galatians

By Prof. JOHN E. McFADYEN, of Knox College, Toronto

With Introduction by Lyman Abbott

Rev. *Henry S. Coffin,* D.D. of New York, says: "Professor McFadyen's book is an ideal Commentary on the Epistles. Ministers and Bible class teachers will find what they need more quickly and more clearly than in any other Commentary with which I am familiar. He wastes no time upon the obvious and he deals thoroughly with every word that needs explanation."

Rev. *Frank K. Sanders,* of Washburn College, Kansas, says: "I have read it with keen interest and growing appreciation. For insight and clearness his work is unsurpassed."

Rev. Dr. *Daniel J. Fraser,* of Presbyterian College, Montreal, says: "The work is splendid. It shows fine insight into spiritual truth and a rare gift of interpretation. I cordially commend it to Bible students and teachers."

Prof. *Charles F. Kent,* of Yale College, says: "It is a splendid product of the practical and historical method of interpretation."

Rev. *Principal Patrick,* of Manitoba College, Canada, says: "It is one of the best Commentaries of its type and can be unhesitatingly recommended for its accuracy and solidity, its ripe and sane judgment, its devout and reverent temper and its easy and agreeable style."

The Nation.

NEW YORK, THURSDAY, MAY 20, 1909.

The Week.

That eighteen Democratic Senators should have voted with Aldrich last Thursday to take iron ore from the free list, and tax it 25 cents a ton, goes far towards answering the question why there is no Democratic party. With brains and principles both out of it, why should it pretend to be alive any longer? Free iron ore was one of the cardinal features of the Wilson bill, as it passed the House in 1894. Two proposals were made, while the schedule was under debate in the House, to put a duty on iron ore, but both were rejected, one by a vote of 136 to 65, the other by 109 to 52. The duty was put back by the Senate, in 1894 as last week; but this was one of the things which President Cleveland had in mind when he denounced the Senate changes as a work of "perfidy and dishonor." Free raw materials in general, and free iron ore in particular, have been the battle-cry of Democrats for years; but when a bill comes up from a Republican House making iron ore free, over half the Democratic Senators join hands with hidebound Republican protectionists to put back the duty. It is not simply a question of iron ore: the whole iron and steel schedule will be affected by the decision to tax the raw material. The pretence of its being a revenue duty is too pitiful. The entire estimated revenue on iron ore, leaving out the Cuban product which comes in under the reciprocity treaty, is $127,000! That is a pretty thin salve for the conscience of the recreant Democratic Senators. They might better have frankly said that they voted at the demand of powerful protected interests in their States. After this, all their talk about wishing to remove tariff burdens and about hating monopolies, will only show how fond they are of being laughed at. The force of self-stultification cannot easily go further.

I cannot allow myself or the departments under me to be made the means of the promotion of the political fortunes of one faction or the other in a State as important as Kansas.

With these words, Mr. Taft has rebuked Gov. Stubbs of Kansas for trying to induce the President inadvertently to favor him and his partisans in an appointment under the Department of Justice. There is no roaring in his letter; no violent denunciation, no use of the shorter and uglier word, but merely a quiet explanation that Mr. Taft is a catspaw for nobody, and that he is building no political machine for himself or any one else. The offence was that Gov. Stubbs had heralded in Kansas Mr. Taft's assent to the appointment of Robert Stone of Topeka as a great victory for himself. He had caught Senator Curtis and Congressman Anthony napping, and carried off a big political plum without their knowledge. Mr. Taft, on discovering this, promptly directed the revoking of Mr. Stone's appointment until the wishes of the Kansas delegation could be ascertained. Mr. Stone's fate rests now with the Kansas Senators and Congressmen, and Gov. Stubbs, who is believed to be a candidate for Senator Curtis's seat, will be careful hereafter not to boast when he turns a successful political trick.

The Tennessee jury which fined some convicted night-riders $500 each and sent them to jail for ten days does not merit all the harsh names that are being applied to it. Critics forget that it first found the defendants guilty under the Ku Klux act, thus forcing the judge to pronounce the death sentence, and that the judge, loath to accept this extremity, ordered another decision. The incident seems to confirm what has often been alleged, namely, that public sentiment would long ago have broken up the night-riding epidemic in Tennessee and Kentucky, if the authorities had not failed in the courage of duty. These twelve jurors of Waverly did as any other honest men would have done, to whom it was proved that the defendants broke into a citizen's house and lashed him nearly to death because he spoke out against night-riders. It was the judge that followed the less illustrious example of the politicians. Backed up by an unequivocal law and by an equally clear verdict, he waived his opportunity to establish a precedent which would ring from the mountains to the Mississippi. Instead, he threatens to patrol Humphreys County with a regiment—and lets the offenders go with a chicken-thief's punishment. Apparently, reform must begin at the top.

It is certainly not pleasant to have the American copyright law described in the German Reichstag as a "crazy pot-pourri of modern ideas and peanut protectionism," but it is still less pleasant to be forced to admit that the description is true. Even with the improvements made by our last codification of copyright laws, our legislation on the whole subject of international protection of literary and artistic property remains backward and benighted. We have been unwilling to go to the root of the matter. Under the Berne Convention, to which nearly all civilized nations except our own adhere, the rights of the foreign author or artist are put absolutely on a par with those of the native. But the United States will not agree to this. By our "manufacture clause" and other complexities and absurdities, we keep ourselves outside of the comity of enlightened countries. The German Deputy who spoke the other day of our copyright injustices, expressed the hope that Americans would soon be driven by very shame into acceding to the Berne Convention. But he does not know how a protectionist Congress may go on for years naked and unashamed.

That the law, properly enforced, can do much to discourage vicious journalism, is shown in a recent editorial in *Bench and Bar*. Commenting upon the publication of letters left by an Albany suicide, a jurist declares that this is undoubtedly a violation of "literary property":

> The right of first publication of any letters, even those having no literary merit, resides in the writer. . . . The publication by another without his consent constitutes an infringement of such right.

The act also violates the New York Penal Code, which, in the opinion of *Bench and Bar*, applies "as well to the case of letters written *by* the deceased person as by others *to* the deceased person." Presumably, this is a commonplace among attorneys, but the unfortunate layman who sees his private affairs in screeching headlines some fine

morning, knows it only as a moral precept. His ignorance it is that emboldens the scandal-monger. Were the baser journals afraid to print private correspondence without authorization, they would soon be made noticeably less offensive.

The college student has much to answer for, but there is one insinuation that he might really be spared. Why does the world go on urging him not to be conceited? This bit of advice is not only stale, but uncalled for. A distinguished State officer, speaking at the recent Cornell dinner, could not keep from shouting out that hoary slander: "My advice to the college graduate would be this: Rid yourself of any idea that a college education gives you a monopoly of knowledge and wisdom. . . . The thing for the college man to avoid is the mistake of assuming, on graduation, that things are all wrong." But, as a matter of fact, the college student who looks upon his diploma as a certificate of eligibility to a ten-thousand-dollar job, is to be found only in tradition and the comic weeklies. The average undergraduate does not know much, but we must do him the credit of acknowledging that he is quite aware of the fact. Like Peggotty, Noddy Boffin, and Joe Gargery, he will readily admit that wisdom, learning, special ability, and anything else that comes out of books, are not in his line. Every alumnus who, out of a fortune made in soap, gives alma mater a new hall of sciences takes care to impress on the college graduate his striking inferiority to the average office-boy. And as for finding fault with established things, would that more college graduates did. The readiness with which men will step from the tradition of alma mater to the tradition of the broker's office is often very disheartening.

Dr. E. H. Nichols, himself a former Harvard athlete and medical adviser of several Cambridge football teams, in a recent address before the Harvard Medical School took strong ground against the coaching of college teams. The present system he described as "an outgrowth of the need, not of avoiding physical injury, but of the necessity of winning." Dr. Nichols is opposed both to the professional and to the graduate coaches. He admits that the games would not be so good if the students were left to themselves, but asks: "What of it? The attraction of the game lies in the fact that we are all partisans." The best remedy for coaching evils would be to cut down the number of games with competing colleges, and to abolish the gate-money which makes possible high-priced coaches and the other extravagances of which Dr. Nichols complains. Nothing would so quickly decrease the great publicity and notoriety given to successful athletes, which also grieves Dr. Nichols, as to do away with the offensive hippodrome features of the inter-university contests. When undergraduates can make $40,000 or $50,000 by a single game, it is but natural that they should waste it upon "rubbers," trainers, coaches, medical attendance, automobiles, lavish supplies of clothes, etc. The cost of living during the training season, the teams expect to receive free of cost. Suppose Harvard were to limit her football schedules to three inter-university contests; the artificial public interest in the team would rapidly decrease. If then, as is the case in games between Oxford and Cambridge, the spectators should have to stand, the Boston newspapers would not find it worth their while to give pages to accounts of the game, and the sport would begin to sink to its proper place in the life of the university. The difficulty with this is the existence of the costly stadia and grandstands. But Dr. Nichols's unrest is another sign that university public opinion is rapidly coming to the point where it will insist upon the use of the surgeon's knife upon these extraneous athletic growths. The sooner this is done, the better for education.

Professor Sumner's conjecture, in the *Forum*, that the civilized world may some day drift back to demonism, is depressing. But a belief in witchcraft is trifling compared with the possibilities that the faith-cure craze recently revealed in Wisconsin. A bill was introduced before the Legislature providing that, in connection with elementary hygiene, public-school pupils be taught how to avoid contagion and the commoner ailments. Thereupon protests began to pour in from all sorts of radical mind-healers; it would be sinful, they cried, to give children the impression that disease was real. Wisconsin papers say that this was the message in hundreds of letters and in long petitions. The Assembly Committee on Public Health, in spite of its three physician members, was over-awed at the first hearing on the measure, and killed it. If superstition is the match of medical science in shaping the educational policy of public schools, then we might as well revert to voodooism. Voodooism at least believes in tuberculosis, and seeks a material remedy. It might even incorporate the correct treatment, too, with its rites.

The South has sustained a grievous loss in the death of Bishop Galloway of Mississippi. Not merely an earnest preacher and a platform speaker of unusual eloquence, he was a man of the highest moral courage and of enlightened convictions. As a writer and a church leader, he threw himself wholeheartedly into the cause of Southern education. One of the first to lend his support to what has been known as the Ogden movement, he by no means limited his sympathy to the interests of one race. At Tuskegee and elsewhere he openly proclaimed his belief in the education of the negro. "Not in statutes or constitutions," he once declared —"not in legislation, State or national— but in the schoolhouses of the country, is the great problem of American citizenship to find its final solution. And in the face of no American child should the door be shut, and from no little hands should the spelling-book be ruthlessly wrested." The gospel of kindliness and confidence between the races had no more earnest advocate than Bishop Galloway, and he lived up to the doctrines he preached. Both races, not merely in Mississippi, but in the South, have therefore cause to mourn his death as that of a genuine leader of the people, and one of those earnest personalities who more than anything else maintain the power of the church.

While the Wright brothers are being toasted for their conquest of the air, somebody ought to take notice of their victory over a much lighter element, namely, the atmosphere of sensationalism and self-advertising in which our generation moves. Nothing in their achievements is more conspicuous than their steadfast desire to be inconspic-

uous. They have never confided to any Sunday supplement that their aeroplanes would soar to the moon. Press-agents were never invited to their experiments, but had to beg for admission like any small boy at a baseball game; and they usually begged in vain. Some said the inventors were only guarding against theft of their ideas; but their indifference toward the wholesale adulation that kings and scientists have poured over them spoils that theory. If their experience aloft with fickle winds has taught them to shun the more treacherous gusts of cheap publicity, then may Heaven speed the day of aeroplanes.

The formal protest of financial London against Mr. Lloyd-George's budget has been described as an "historic event," and, judged by the apparent unanimity of the adverse judgment, is probably a "wholly unprecedented action." It is difficult, however, to pass judgment upon this protest without recalling another expression of financial opinion, filed with the British Ministry as a result of a responsible meeting in "the City" some weeks ago, for the immediate construction, not of four Dreadnoughts as had been contemplated, but of eight. Now, a Dreadnought is an expensive luxury. The estimated cost of one of them is $10,000,000; four of them would very nearly equal the total appropriation for old-age pensions as defined by the Ministry for the coming year. The meeting at the Guildhall did not instruct the Ministry as to how or whence the extra $40,000,000 was to be procured. A "naval loan" was faintly suggested, but the idea was promptly vetoed by serious financiers, who were well aware that the present low price of British government bonds is a dead-weight on investment markets, and who were under no illusions as to what would be the upshot of cheerfully embracing the plan of building extravagant armaments on credit. But if "the City" did not solve the problem of raising money for a doubled outlay on armament, the Chancellor of the Exchequer did. His response in substance was: You people of financial London insist on new Dreadnoughts. Very well, you shall have them; but you shall also pay for them. We do not pretend to say that Mr. Lloyd-George's piling of three-fourths of the new taxation upon incomes, legacies, and the Stock Exchange is an equitable distribution of a national burden for the general national welfare; but the facts of the matter certainly do lend a good deal less impressiveness to last week's protest of the bankers. For "the City" to get frightened over mysterious stories of Germany's enormous naval construction plans, to pass resolutions demanding extraordinary increase in Great Britain's naval outlay, and then to complain because the bill is so high, is a course somewhat wanting in dignity.

From France, it is at present reported that the separation of church and state has so far brought little benefit to the nation. There is a visible decline in the moral tone of the people, an increase of crime, and a growing public restlessness which may prove dangerous to the state. Even the financial results of the campaign against the church are said to be disappointing. We take it that such reports are strongly partisan. Three years are scarcely enough to test a serious change in the moral condition of an entire people. On the other hand, the last three years have shown many an added reason in explanation of the French anti-clerical temper. Profess as it may that it is no enemy of the republic, the church in France seemingly lets no opportunity pass to show that an enemy it is. Last Sunday's royalist banquet at Paris is an instance. Why was the feast in honor of the beatification of Joan of Arc made the occasion for shouting "Vive le roi!" and "A bas la république!"? After this, what chance is there for the moderate churchmen who, here and there, would be working for a reconciliation with the government? The royalist cause in France as a direct issue is dead, but it has vitality enough to make the lot of the French Catholics a hard one in these days of Radical ascendency, which the royalists are doing their best to perpetuate.

There was never any doubt that M. Clemenceau would get his vote of approval from the Chamber whenever he wanted it. He manœuvred skilfully to make that vote as imposing as possible, and succeeded. Had the question of confidence been put a few days earlier, when the postal strike was only a threat, personal motive might have asserted itself above principle. Clemenceau's enemies and rivals would have lined up against him, and his margin of victory might have been narrow. With the strike actually under way, the Deputies dared not refuse the government their support on what had become a matter of vital public concern. Not even the most ambitious of Ministerial candidates would venture to overthrow a Ministry on an issue that would mean his own speedy ruin in turn. If the Clemenceau Cabinet had gone down before the strikers, what government could subsequently hope to maintain its authority? On the general vote of confidence last Thursday, the Chamber gave Clemenceau a majority of 206; on the motion repudiating the right to strike for public servants, the majority was 385. If the Chamber will now proceed to redeem its promise to settle definitely the legal status of government employees, the present crisis will quickly cease to be threatening.

The resignation of Dr. Paasche, the National Liberal leader, and chairman of the Tax Committee of the Reichstag, looks ominous for Von Bülow's *bloc*. A vice-president of the Reichstag, and long one of its most influential members, Dr. Paasche resigned because, on a point of procedure, his adherents were voted down by a combination of Conservatives and members of the Centre. As the latter party has been the especial enemy of the *bloc*, the action of the Conservatives is regarded as rank treason and as notice that they will no longer abide by the Bülow arrangement. The Central Committee of the National Liberal party, which is to decide the course of that party in Berlin to-day, is bound to be the more angry because Dr. Paasche has been succeeded as chairman of the all-important Tax Committee by a member of the Centre. Radicals and Liberals, it is expected, will unite in informing the Chancellor that they will no longer coöperate with him if the Centre is to have anything to do with the financial proposals hereafter. Von Bülow thus faces the severest test of his career. He must either return to the old coalition of Conservatives and Clericals, and swallow the brave words uttered when he broke with the latter, or decide that discretion is the better part of valor and insist on the acceptance of his resignation.

THE PEOPLE LOSING A WEAPON.

We have already reached the period of tariff recrimination. The two political parties are charging each other with tne responsibility for making the Aldrich bill so bad. "You are not keeping your pledges," assert the Democrats, "to make an honest revision of the tariff downwards." "But you were pledged to that more stiffly than we were," retort the Republicans, "yet here you are voting for a duty on iron ore, and for every other tariff tax that you are interested in locally." This twitting on the record passes easily into predictions about the political consequences. Gov. Johnson of Minnesota declares that, if the party in power does not keep faith with the people, in the matter of tariff revision, "the Middle West is lost to the Republicans four [meaning three] years hence." On the other hand, an old Republican leader in Congress affirms: "A Democrat who denounces the tariff law in the next campaign will be in a sorry plight. When a Democrat tells you that he is for a tariff for revenue only, he means that he wants protection for the State or district which he represents." Behind all this stands the figure of Bryan. He is writing letters to his friends in Washington to say that the failure of the Republicans to revise the tariff honestly means a Democratic House in 1910 and a Democratic President in 1912. But even if that result seemed written in the book of destiny, Bryan as a candidate would be able to undo all.

The trouble goes deep. It is not a mere question of a particular issue, like the tariff or any given election, but of tne whole theory and operation of government by party. We have always been taught, and the whole experiment goes upon this basis, that when one party in office becomes unresponsive to the popular will, or visibly corrupt, the thing to do is to turn it out and put in the other. That was the normal process, as President Taft himself has described it, when the Democrats under Grover Cleveland ousted the Republicans in 1884. The latter had been too long and too unchecked in power, and the country turned from their inefficiencies and vices to the Opposition party. But that remedy for political ills, that weapon in the hands of the people, we seem to have been losing in recent years. It is not only that the Democratic party has been in the hands of a leader with an unequalled capacity for repelling support, and a perfect genius for disaster. That might in time be outlived; but when we see the practice of the two parties, no matter what their professions, very much alike, and are deprived of the power to get done by one what the other refuses to do, we cannot help feeling that both the present fact and the future outlook are disquieting. Government by party, we suddenly seem to be finding a broken reed.

Consider how the matter stands in the State of New York. A really efficient and public-spirited Opposition party at Albany this past winter could have taken advantage of the rupture between the Governor and the machine-politicians of his own party, not only to do something worth while in the way of legislation, but to place itself in a fine strategic position for the next State campaign. But what was actually done by the Democratic leaders in the Legislature? Why, they entered into secret agreements with the worst of the Republicans, and made themselves part and parcel of the thing to be reprobated. The alliance of Raines and Grady could not have been more certain if it had been signed and sealed in a formal document. They were hand in glove throughout the session; and in the closing days it was hard to tell which was the leader of the Senate, rushing through bad bills and defeating good ones, Raines or Grady. So when the time comes to bring all these matters under debate in a political campaign, the result is sure to be great uncertainty and confusion, because we have not a clear alternative of parties before us. Just as on the tariff issue in national politics, the Democrats have so unblushingly abandoned their platform and their avowed convictions as to disable themselves from appealing against Republican faithlessness, so in New York the Democratic management has shown itself adept in the very evils it denounces. Where shall the citizen turn who has been brought up to believe that if the people cannot have their will through one party, they can through the other?

Whatever the reply to that question, one notice should be publicly served. It is that a party in power cannot depend indefinitely upon immunity, no matter what its sins, so long as it can say, and prove, that the party out of office is just as bad as itself. Angry electors will not forever stand uncertain. They will make a choice, even if it prove to be mistaken. The desire to punish a recreant party is often so powerful that voters will not be too fastidious about the means they employ to do it. Republicans drunk with power have had their disagreeable awakening before now, and may easily have it again if they allow themselves to be dragged after Aldrich's high-tariff chariot. President Taft, in endeavoring to hold his party honorably to its pledges, is not simply working at the task in hand of revising the tariff, but is doing something to make government by party respectable and feasible.

FALLING IN LOVE WITH TAXES.

A German professor of economics has hit upon a discovery which had never swum into the ken of finance ministers or legislators—that taxes should be loved, not hated. This University man, Prof. Adolf Wagner, recently addressed a public meeting at Cologne, and sang the praises of fresh taxation. The efforts of the government to impose new levies upon the people ought not to be denounced, but hailed with joy. They were a sign of expanding national wealth. Instead of being regarded as burdens, heavier taxes should be thought of as mere bagatelles for a rich people. Professor Wagner had heard a lady in a railway carriage say that her new hat had cost "only $150." There ought to be the same disdainful tone about high taxes. "I have paid to the government only 12 per cent. of all my income." "I have given up to the tax collectors only one-half of my revenue from real estate." If we come really to love being taxed, we should be much happier ourselves, and only think how happy we should make our rulers!

Professor Wagner evidently sees no necessary truth in the old maxim of statesmanship, cited by Burke, that it is impossible to tax and to please. If taxation is made a form of flattery, the result may be different. Let a Finance Minister preface his schemes for new imposts by saying that his people, as the richest and most patriotic and good-natured people on earth, will pay up, not only without a murmur, but

with expressions of pleasure and gratitude. This is certainly a new point of view for the tithing-man. Instead of approaching the taxables with sour and vinegar aspect, he ought to come along in jolly fashion, like one doing a favor. In this view of the matter, the English Chancellor of the Exchequer, when introducing his recent budget, made a great mistake in speaking as if his function were to give offence, instead of to waken thankfulness:

> Up to the present we have been considering the naval problem from the point of view of merely spending money. I shall now have to invite hon. members and the country to consider it from the equally essential but less agreeable standpoint of paying for it. Spending is pleasant, paying is irksome; spending is noble, paying is sordid. And it is on me falls the making of arrangements for the less attractive part of the naval programme.

This is far from the glad tone of Professor Wagner, or from the note struck by our cheerful taxers at Washington. Their description of the proposed protective taxes quite overcrows the attempt of the German professor to make the paying of taxes a joy. For if our Senators may be believed, the tariff they have in mind is like the combined blessings of nature—like dew and sun and fructifying showers to make fertile the land which, but for protective taxes, would be a sand heap. Are we, then, such curmudgeons that we shall resent giving up a little of our easily earned money—all money is earned easily under the protective system—in order to make gladness for thousands? Why, Senator Scott and Senator Oliver can demonstrate that, if you only consent to pay a few cents more for glass, you will fill the shop with the busy hum of industry, while reducing the bonds of its Senatorial owners to less than 10 cents on the dollar. And Senator Aldrich can make plain to the meanest understanding that slightly higher taxes on woollen clothing will make it really cheaper—or would, but for the rascally jobbers—while keeping still more thousands of American workingmen steadily employed, and still further impoverishing the proprietors of the mills. This way of presenting the attractions of taxation has never, we are certain, been dreamed of in the philosophy of Professor Wagner. Were he privileged to attend one day's Senate debate on the tariff, he could not fail to conclude that taxes were a matter of hilarity.

We greatly fear, however, that the jocular view of taxes will have all the fun knocked out of it before it wins a way to acceptance. Stupid people will go on seeing the facts of taxation very much as Adam Smith set them forth. They will not fall in love with the swarm of officers, "whose salaries may eat up the greater part of the produce of the tax"; and will obstinately refuse to regard taxes as anything but a form of "trouble, vexation, and oppression.' It begins to appear that even in Washington the idea of taxes as an evil—necessary, but an evil—is getting the upper hand. Senators, who at first thought the country could be made consciously happy by over-taxation, are beginning to discover that high taxes are one of those blessings that brighten as they take their flight. Hence the outlook for a real reduction of the tariff is better than it has been. Despite Professor Wagner, it is difficult to make people fall in love with taxes by adding to them. As Speaker Reed said when it was proposed to enlarge the national territory by annexation: "There is more already than I can really love."

SEEING THE PACIFIC SLOPE.

One of the advantages resulting from the exhibitions held in ambitious Pacific Coast cities—the latest being the Alaska-Yukon Pacific Exposition at Seattle, which begins on the first of June—is that the wondrous sights, combined with reductions in railway fares, tempt thousands to cross the Rocky Mountains for the first time to see whether there is any basis for the cry: "Why go to Europe?" Has not our country scenic features grander even than those that are to be seen on the other side of the Atlantic? Should we not, before going abroad the fifth or tenth time, see something of our native land, so that we can tell inquisitive foreigners about it and aid Karl Baedeker in his efforts to divert part of the European tourist stream to our own shores?

When the first transcontinental railway was planned, nearly everybody doubted the possibility of its financial success. To-day, there are eight of these lines, with another fast nearing completion, and all will be kept busy this summer with the tourist traffic. The question regarding the most advisable route is easy to answer. On the whole, it is best, at least during May and June, to go by one of the Southern lines, returning by one of the Northern. The Southern Pacific presents advantages to those who may contemplate a side-trip to Mexico. The Santa Fé route affords opportunity to visit the Navajo and Moki Indian reservations and the petrified forest; but the lion of this line is the Grand Cañon of the Colorado River, in Arizona, now reached conveniently by the branch railway from Williams. This stupendous chasm (which is often confused with the Grand Cañon in Colorado, along the Denver and Rio Grande—a wonderful sight, too) is absolutely unique; Europe has nothing even remotely resembling it. Unique, too, is The Yosemite Valley, with its waterfalls descending from dizzy heights, its precipices, its domes and half-domes, its mirror lake, its red snow plants, and a hundred other astonishing spectacles, some of which, as John Muir has remarked, are so strange that they surprise even Indians, horses, and dogs. But before seeing the Yosemite, the tourist who goes by either of the lines named will, of course, spend some days in Los Angeles; he will have a chance to see the olive and orange groves and bathe in the Pacific; to enjoy, at Catalina Island, what Frederick G. Aflalo, editor of the Anglers' Library and England's leading authority on the subject, calls "the finest sea-fishing in the world"; to spend a day and night on top of Mt. Wilson, and after enjoying the varied views which have given this peak the name of the magic mountain, gaze at the stars, in the observatory of the Carnegie Institution, through the largest lens ever made.

On the way to San Francisco, should the visitor prefer combined views of ocean and mountains to the Yosemite, he can take the new coast line, which affords an opportunity to visit some of the old Spanish mission houses, and, at Monterey, to enjoy a cactus collection, equal to any wild desert garden of Arizona or Mexico. The new San Francisco is worth seeing; in the words of President Wheeler of the University of California, it is "immeasurably finer from an architectural point of view, and immeasurably more solid and useful from the business point of view, than the old"; and in two more years—five after the disaster—there will be no

other external trace of the old city left than the improvement on every hand.

Tahoe, loveliest of mountain lakes, makes one of many fine excursions from San Francisco, unless the tourist goes by the Union Pacific and takes it in, with Salt Lake City, on the way. Going north, the snowy summit of Mt. Shasta fascinates the eyes for five hours while the train, on the way to Portland, encircles it. Crater Lake, one of the unique wonders of Oregon, can this summer, for the first time, be reached conveniently by rail from Weed to Klamath Falls, thence by boat and stage. Mount Hood is easily ascended, and half-way up is Cloud Cap Inn, where one can stay and study the stupendous glaciers of "our noblest volcano," as A. H. Sylvester of the United States Geological Survey has called it.

From Portland, Seattle is reached via Tacoma in a few hours, with the grandest of snow mountains always in sight, including that "mountain of mountains," Tacoma—or Rainier, as it is now (but should not be) called—the climax of the California-Oregon series of snow peaks. These snow-clad volcanoes derive their grandeur from the fact that they are seen at sea-level, full height, whereas the Swiss peaks are shortened by the five or six thousand feet of elevation, whence they are usually seen. The Seattle exhibition-grounds will owe much of their attractiveness to Oriental, Alaskan, and Indian features After his visit to them, the tourist is ready to return. He may choose the Northern or Union Pacific, and see the Yellowstone Park, with its waterfalls, cañons, and geysers, unlike anything to be seen in Europe; or he may take the Great Northern, stopping off at the Flathead Reserve to see Lakes MacDonald and Ava'anche. "Give a month at least to this precious reserve," is the advice of John Muir; and a month is not too much for the Yellowstone. If more snow-mountain scenery is desired, the Canadian Pacific is the road to take, by all means. On this, for nearly two days, the tourist has in view, on both sides of the train, one magnificent chain after another, till he is almost bewildered. He will then be able to understand the meaning of the confession of Whymper, the great Alpine expert, that there are in British Columbia fifty Switzerlands. Undoubtedly, we miss many of the things that make a summer in Switzerland alluring. We merely suggest that our Pacific Slope is worth seeing, too; and if the traveller has time to extend his trip to Alaska, he will find a series of fjords, framed in by snow peaks, surpassing the Norwegian in grandeur.

THE WINNING TYPE OF YACHT.

In the perpetual race between different types of boats for the favor of the yachting public, the gasolene yacht is rapidly distancing all its competitors, steam or sail. Although about as new an invention as the automobile, its number is also legion, its variety endless. Originally placed with much distrust in open launches, the explosion engine has made its way rapidly into larger and larger pleasure craft, until to-day it is a rare exception if a yacht under one hundred feet is provided with coal-using machinery. More than that, the time has already come when the gasolene motor is actually driving out of boats steam machinery long and successfully in use. For instance, it has just become known that Gen. E. A. McAlpin, the purchaser of the steam yacht Sentinel, 108 feet in length, has found it worth his while to remove her boilers and engines, and install compact gasolene motors.

The gains are obvious. The space saved by the installation of the more compact motive power permits the construction of two additional staterooms, and gives increased living room elsewhere. The new engines not only yield double the power, but weigh considerably less; to the gain in speed must be added also the benefit of a reduced engine-room crew, one gasolene engineer taking the place of steam engineer and fireman. But the owner profits in still other ways. With the hot boilers taken from the interior of the boat, goes the unpleasant odor of steam and oil. The labor, dirt, and annoyance of taking on coal and water, and discharging ashes, are avoided. The craft is ready for instantaneous service; there are no more banked fires, while getting up steam in a hurry is a thing of the past. Gasolene boats can reach their maximum speed within five minutes after the owner comes on board unexpectedly, and there is no fuel consumption except when the boat is actually under way. The saving in fuel thus made is so great as wholly to offset the lower price of steam fuel.

One has only to consider the numerous emergencies in which motive power is hastily needed to realize how valuable is this immediate mobility. Had our battleships at Santiago possessed it, the Spanish fleet would have had no chance of escape whatever, and the battle would have been fought directly off the harbor mouth. The same reason has induced the Police Department of New York to replace its steam launches with motor-boats, and it reports a considerable gain in efficiency. A steam life-boat was an impossibility; the gasolene life-boat is a marked success, for its engine can be brought into action as rapidly as the rocket-gun. Immediate mobility often means an increased margin of safety in a crowded harbor, or in a sudden and dangerous blow, and this is why many owners of sailing craft, who once swore that nothing in the world would make them resort to so unseamanlike a device, have first shamefacedly installed an auxiliary engine and then learned to brag about it.

But it is the decrease in the cost of yachts when equipped with motors that is, after all, the most important feature of this marine revolution. People who never dreamed of owning a craft in which they might comfortably voyage from New York to Bar Harbor, suddenly find themselves granted the freedom of the coasts at a comparatively small expenditure. The number of cruising motor-craft between fifty and ninety feet is astonishingly large. Never a week goes by but a new one is announced in the press or in the marine journals. Generally the owner is his own skipper and spends most of his time at the wheel watching his boat log off from twelve miles an hour upward. The newer boats are designed with greater and greater regard for seaworthiness, and ability to undertake deep-water cruising. The amount of living space on such a craft is quite extraordinary when contrasted with the old-time steamer. Thus a typical boat seventy feet in length, just launched, contains one state-room with four berths and two single state-rooms, together with a bath-room. The main saloon is placed forward, and rises several feet above the deck; it contains two sofas, readily made up into berths. In the engine room are two thirty-horsepower engines, entirely cut off from the rest of the boat by water-

tight bulkheads. On its davits, this yacht carries a small speed-launch, which is capable of eighteen knots. The boat itself has an extreme breadth of fourteen feet and draws only three and one-half feet.

From this size down to the little "one-man" cruiser, the variation is infinite; but the amount of pleasure to be obtained depends in no degree upon the size. Wherever one goes, down the Potomac, in the remote recesses of Chesapeake Bay, in Florida waters, or moving noiselessly along the northernmost coast, or the great canals, this form of agile houseboat is ever under way. Its range is astonishing. A fifty-six-foot cruiser, just built at Morris Heights, has a radius of 1,200 miles before it becomes necessary to think of renewing the fuel; and the cost of this handsome boat is but $8,000. Even the State of New York has caught the contagion and built a superb eighty-foot boat for the head of its Public Works Department, for his cruises on the canals. Every department of the Federal government is rapidly acquiring vessels of this character. Indeed, so great is the output of these yachts, many of which cost less than an expensive imported automobile, that a prominent designer recently expressed his belief in the total disappearance of sailing craft within twenty years. But this is a prophecy of pessimism. No motive power yet produced can provide the thrills and the joys or the health-tonics of the old-fashioned catboat or the more modern knockabout, to say nothing about the vigorous young seamen they turn out.

JOHN KEATS'S PORRIDGE.

William Watson has brought the charge of blood-guiltiness against the English nation because it let poverty and overwork drive John Davidson to suicide. One of the oldest problems in political economy is thus raised again. What shall we do with this poet's trade, the worst paid of all handicrafts and professions, the trade most in need of government regulation, if ever there was one? No one has ever suggested a minimum wage for poets other than that which is distributed through the poorhouse. No Legislature has passed factory laws for their protection, though as a class they are notoriously more sensitive than women, and more defenceless than children. They are allowed to work at all hours of midnight and in garrets which the anti-sweatshop law has declared unfit for the manufacture of tobacco and cheap clothing. The well-known irritable temper of the tribe makes it impossible for them to organize into unions. In an age of advanced industrial specialization, they cling to the primitive methods and standards of three thousand years ago. They persist in producing things they like, and not what the great public likes. They insist on looking forward to the future or back to the past and giving little thought to the all-important present. They will come back again and again to their ancient preoccupation, the soul of man, whereas food and drink are never to be had by looking within, but without, and all about, and pretty sharply at that.

Mr. Watson's indictment of the English people has recalled a plan once laid before the French Parliament by Alfred de Vigny, author of "Cinq-Mars" and "Chatterton." De Vigny proposed that an author who had produced a work of exceptional merit should receive a government pension for five years. At the end of the period, if his work showed improvement over his first effort, his pension should be confirmed for life. If his work showed no advance, the pension was to be withdrawn. "The scheme," we are told, "was not of a nature to appeal to practical men and it did not pass into law." Of course, the initial absurdity was that De Vigny should have laid a scheme concerning poets before a legislative assembly made up of practical men. A poet himself, De Vigny felt that the divine fire had only to manifest itself to be acknowledged; but the practical man would say: "What percentage would you allow for the moral tone of the poem, and how many poets would you apportion to every department and arrondissement?" De Vigny believed that more than one Chatterton had been sent to his grave by sheer want, but the practical man would argue that somewhere he has heard of suffering as a good thing for poets. But what makes the practical man's case invulnerable is the fact that the poet himself, as a rule, does not cry out against poverty. He has accepted it proudly as the badge and certificate of his trade.

What the poet needs is apparently not more bread and meat, since such things are to him unimportant, but a stiff upper lip. It is quite true that he is miserably paid; but so is every high service the world receives. In proportion to the value he sets upon his labors, the wages of the poet are no worse than those of the pioneer, the inventor, the philosopher, the teacher, and the prophet. Say that the world pays for work inversely as the cube of the value rendered, and you have a pretty safe approximation. We pay our millionaire more than his broker; we pay the broker more than his chauffeur; we pay the chauffeur more than the man in the coal pit; and we pay the miner more than his wife. We pay our lobbyists more than our lawyers; we pay our lawyers more than our judges; and we pay our judges more than the man who serves society by keeping out of court. We pay our college "executives" more than our professors; we pay our professors more than our scholars; we pay our scholars more than our thinkers, whom we pay mighty little at all. This law is universal. We pay the bad novelist more than the good novelist; we pay the good novelist more than the bad poet; we pay the bad poet more than the good poet; we pay the good poet more than the prophet, whose wages in his own valley are notoriously meagre and uncertain. And if we rise above the prophet to services more than human, we know very well what the world pays for that.

Poor as he is, therefore, the poet has no exceptional cause for complaint. If the necessity of earning his bread holds him tied to an office desk all day, he is not much worse off than the college professor who eats his heart out in a roomful of drones, while the *opus* of his life keeps retreating before him; not much worse off than the artist who must draw for the fashion magazines and text-books on anatomy; not much worse off than the member of a profession whose traditional fare is locusts and wild honey. Spinoza found time to build up a philosophical system while grinding his lenses, and Kant built up another system while teaching for his bread. Poets are by no means Mr. Rockefeller's sole customers for midnight oil.

GEORGE MEREDITH.

The death of the great novelist Tuesday morning, so soon after that of Swinburne, is another sign to show us how completely the Victorian generations have passed away. To those of us whose minds were formed under these masters, it is as if we were sitting in a theatre at the close of the evening, when the actors one after another have spoken their parts and made their exits, and only Mr. Hardy is left upon the stage, pronouncing his "Dynasts" as a solemn, mystical epilogue on the meaning of the play. Other times, other men. Messrs. Shaw and Wells and Chesterton, like wrangling comedians, are ready to amuse us with their antics before the last curtain falls; but we do not know who are the actors or what the plot is to be of to-morrow's play.

By date, Mr. Meredith might almost be reckoned among the mid-Victorians. His "Ordeal of Richard Feverel" came out in 1859, the year of Thackeray's "Virginians," Dickens's "Tale of Two Cities," and George Eliot's "Adam Bede"; but the very setting together of these names shows how entirely in spirit he belongs to a later generation. He stands rather with Gissing and Hardy, as one of the three who took up the censure of life where the earlier three had left it. To most critics he is the greatest of the late-Victorian novelists, not so poignant as Gissing or so popular as Hardy, but greater in his relation to the age than either. Such a criticism may be right, yet what superb qualities are in the other two that Meredith wants! Gissing, in his earlier and more significant novels at least, may be utterly dark and pessimistic, yet his language has always a poise and fluent charm, beside which the sentences of Meredith seem to rasp and jar like unoiled machinery. And there is, too, in Gissing at his best, in the infinite pathos of "Thyrza," that madonna of the slums, in the bleak yet heroic misery of his "New Grub Street," in the stark horrors of poverty, not without glimpses of beautiful magnanimity, of his "Netherworld"—there is in him at his best a sense of the underlying waste of civilization which, to a strong reader, makes the characters of Meredith seem in comparison to move upon the surface of things.

And with all Hardy's lack of assured art, despite the unaccountable amateurishness of half his work, he has a wealth of emotion and imagination for which Meredith can give no equivalent. The Dianas and Claras and Vittorias of Meredith's society are subtle creatures, drawn with grave or glancing lights, but none of them reaches so deeply into human nature as Eustacia Vye of "The Return of the Native," with her "Pagan eyes, full of nocturnal mysteries." There is no inanimate scene in Meredith's world that so deceives us with the sense of possessing a deathless soul as does Egdon Heath of the same novel:

> Every night its Titanic form seemed to await something; but it had waited thus, unmoved, during so many centuries, through the crisis of so many things, that it could only be imagined to await one last crisis—the final overthrow. . . . To know that everything around and underneath had been from prehistoric times as unaltered as the stars overhead, gave ballast to the mind adrift on change, and harrassed by the irrepressible New. The great inviolate place had an ancient permanence which the sea cannot claim.

There is no better way to bring out the qualities that distinguish these two contemporaries than to compare such sentences as these of Hardy's with the most famous of Meredith's descriptions —with the boating scene, for example, at the weir in "Richard Feverel," radiantly beautiful as that scene is, or with this brief picture from "Sandra Belloni":

> A half circle of high-banked greensward, studded with old park-trees, hung around the roar of the water; distant enough from the white-twisting fall to be mirrored on a smooth heaved surface, while its outpushing brushwood below dropped under burdens of drowned reed flags that caught the foam. Keen scent of hay, crossing the dark air, met Emilia as she entered the river-meadow. A little more, and she saw the white weir-piles shining, and the gray roller just beginning to glisten to the moon. Eastward on her left, behind a cedar, the moon had cast off a thick cloud, and shone through the cedar-bars with a yellowish hazy softness, making rosy gold of the first passion of the tide, which, writhing and straining on through many lights, grew wide upon the wonderful velvet darkness underlying the wooded banks. With the full force of a young soul that leaps from beauty seen to unimagined beauty, Emilia stood and watched the picture. Then she sat down, hushed, awaiting her lover.

What impresses the imagination in Meredith is the fulness of present life; nature, in complete sympathy with the living heroine, seems like her to leap from beauty seen to unimagined beauty; whereas in Hardy the present is but a moment in immeasurable time, and we are more moved by influences reaching out of an enormous past than by the drama acting before us. It is the contemporaneity of Meredith that forms both his strength and his limitation. A philosopher, thinking of these two contrasted minds, would be tempted to explain them by the new psychology of M. Bergson, which all the world is talking about just now—and very few are reading. Consciousness and reason, says our philosopher, are two different and hostile things. Consciousness is an unbroken chain of experience in which the past is continually taken up into the present, held in solution, so to speak, and so passed on to the future. Reason, on the contrary, which has to do only with the activities of the present, breaks up our consciousness or experience into discrete sections. It would be instructive, but a little bewildering perhaps, to follow our philosopher in his application of this theory to literary criticism. Meredith is the rationalist *par excellence* among writers of fiction; his power is in reason and analysis and point. If, then, M. Bergson is right in making reason the antithesis, even the destruction, of our deeper consciousness, the astonishing agility of his mind in comparison with Hardy's occasional dulness would go naturally with a certain shallowness and an insensibility to the deeper currents that flow beneath our bustling activities.

But it is not the Bergsonian philosophy that will make or mar the fame of Mr. Meredith, and its intrusion into our loss is almost an impertinence. Just now we are reflecting on his abundant treasures of wit and on his world of living people, and asking doubtfully who is to carry on the great tradition of letters.

IMPRESSIONS OF SWINBURNE.

London, May 5.

The death of Mr. Swinburne deprived our literature not only of our last universally acknowledged poet, but of a scholar immensely learned in the whole range of literature, classical and modern. The son of an ancient and Jacobite house in Northumberland, and an Etonian of the least athletic type, Mr. Swinburne resembled Shelley as a born aristocrat, with at least a literary passion for democracy. It is hardly conceivable that, as a poet and an Etonian in boyhood, Mr. Swinburne should not have modelled himself, more or less consciously, on Shelley.

I never heard any anecdotes of his school days, but when he came up to Balliol, he did not amuse himself by "ragging the dons" in Shelley's manner. He lived very quietly, mainly in the society of Mr. Nichol, a Scottish student, who was later professor of English literature in Glasgow. He did not, like Calverley, leave a lively tradition behind him; scouts remembered him as "a very quiet gentleman." He obtained a university scholarship in modern languages, and, I think, took only a second class in moderations, though his Greek Elegies, in "Atalanta in Calydon," are not only good as Greek verse, but as poetry.

He was contemporary with Mr. T. R. Green, the Hegelian philosopher, who was not greatly addicted to the Muse; and he wrote a little, mainly against his *bête noire*, Napoleon III, in a serial called *Undergraduate Papers*. When Mr. Swinburne's "Atalanta in Calydon" and "Poems and Ballads" came out in 1865-1866, they captivated my undergraduate mind; the second volume was more popular with the young than that which I greatly preferred, "Atalanta." Balliol was not a literary college at that time, but Mr. Saintsbury records that "Poems and Ballads" had a *succès fou* at Merton.

"Atalanta in Calydon" could not be ignored. To my taste, this work of his youth, for the merits of its blank verse and the varied music and original measures of the choruses, was his best. One opened it, knowing not even the name of the author, and one was carried away on the strong stream of the tragedy. It might not be Greek in sentiment—"Erechtheus," later, was much more Greek and much less captivating—but it was new poetry and true poetry: immortal poetry, I think.

The famous "Poems and Ballads" of 1866 really broke the spell, and the reading public, that little flock, careless of the revived Greek tragedy, was much excited about the new volume. A hubbub of protest arose, not unnaturally, for while it is full of splendid lyrics, it also contains things which then, and now, I was, and am, Puritan enough to regret. The passion of a knight who loves a leprous lady, is not, I think, a subject for art; and Mr. Swinburne's passion was never natural and sincere; it was always declamatory and literary. This is the defect of his poetry, the emotions have a literary origin, and every character is equally copious, vigorous, and unconvincing. In the dramas it is the verbal music and the rhetoric that please us; Mary Stuart and Mary Beaton (who has an historical *alibi*, if that matters, and never saw her Queen after 1567) certainly did not express themselves in Mr. Swinburne's way, except when he does Casket Letter 11 into blank verse. We are not to look for humor in his plays; he very greatly appreciated humor, especially that of Dickens among the moderns, but he was not a humorist. This defect permitted him to employ his unequalled vehemence of language in his prose. He greatly esteemed Scott, yet he wrote:

> This insultingly reckless and savagely stupid example of headlong and brainless insularity is less inexplicable and scarcely more lamentable than the immoral and perverse infatuation which made Scott speak of one of the basest and shamefullest slanders that ever dropped from the lying lips of Byron as a mere sample of his love of mystifying: which may indeed be referred to that of mischief.

I have, by research, discovered the first of these sins of Sir Walter. He spoke of a certain Italian in London literary society as a noisy, illogical, ugly bore. It appears that this Italian was "a noble poet," but it does not follow that he was not, socially, an ugly, noisy, illogical bore. The second of Scott's sins was his attributing to Byron's love of mystification and of mischief, his story that Cam Hobhouse wrote a dedication to himself which Byron signed. This tale Byron imposed on Bankes, who told Scott, and what Scott did was to inform Bankes that Byron had gulled him—so as to prevent him from repeating the fable. Sir Walter took the most charitable view possible of Byron, though Byron had "bet him," as he said, with the public. I really do not think that he appears immoral in this matter, and cannot share the alliterative indignation of Mr. Swinburne.

His criticism, though so learned, is injured by his flights into the empyrean of praise and his frenzies of blame. *Non tanti est*, Sir Walter would have said, nothing is worth such "dæmoniaco-seraphic" floods of invective and applause. Byron and all the Bonapartes and Mr. Carlyle infuriated Mr. Swinburne. "Truth is truth," he says, "though it be a Carlyle or a Gladstone, a Pigott or a Parnell, who affirms it." What is "that famous effusion of pessimistic lechery which gives us in metrical form the moral quintessence of Calvin and Bacchus, of Priapus and Carlyle"? It must be a queer composition, but Mr. Swinburne knew so much that he puzzles the ignorance of an ordinary reader.

He seems always to have been young; age put no water to his wine; he was a patriot, though he called himself a republican; but other patriots, when he attacked our open enemies, wished that he would "draw it mild"; but that was the one thing which Mr. Swinburne could never do. In his use of language, he knew not limit.

It is a puzzle that his vast knowledge of the best literature never taught him limit, never enabled him to see that the rapier of Pascal is a better weapon than the bludgeons of Milton, when controversial, and of John Knox. *Suffl*aminandus erat, as Ben Jonson said of Shakespeare, but who could put the drag on Mr. Swinburne?

ANDREW LANG.

NEWS FOR BIBLIOPHILES.

The new "Index to Book-Prices Current" 1897 to 1906, compiled by William Jaggard, and just published by Eliot Stock, is an admirable piece of work, and one whose sale certainly can never recompense its editor for the three years spent upon it. It is a volume of nearly 1,100 pages—more than double the size of the Index to the first ten volumes of the annual, 1887-1896—containing about one hundred thousand entries under authors or titles with cross-references under important subject headings.

The following are new features of the work showing the improvement over the first volume: There is a great increase in the total number of anonymous and pseudonymous names, to hundreds of which are attached the real names of the authors; the names of editors, collaborators, composers, translators, and chief artists are indexed; to every entry, except in comparatively few cases where the year cannot be ascertained, the date of publication is appended; in numerous cases where the illustrations impart a special market value, the artist's name is indexed also. As Mr. Slater's annual record is arranged chronologically and the contents are inaccessible except through the Index appended, this combined Index to ten volumes adds largely to the utility of the series. It is prefaced by a chatty and interesting introduction by Mr. Jaggard, and by a list of Bibliophiles and Bibliopoles, that is of the collectors and owners of the chief libraries dispersed during the first twenty years of the lifetime of "Book-Prices Current," 1887-1896.

Frank Karslake, editor of "Book-Auction Records," has compiled and published "Notes from Sotheby's," a compilation of 2,032 notes from catalogues of book-sales held at Sotheby, Wilkinson & Hodge's rooms, between 1885 and 1909. Many of these contain bibliographical or literary information not readily accessible elsewhere; but some are mere statements of commonplace if not universal information, and as auctioneers are prone to exaggerate the rarity of their goods, some of the statements made as to the number of copies are not borne out by the facts. Thus, the note to the first copy offered of Lamb's "King and Queen of Hearts," 1809 (here misprinted 1509), sold on March 17, 1902, is given, with the misleading statement that "it is probable that 1809 is a misprint for 1806." In a later sale, June 3, 1902, a copy of an earlier edition dated 1806 was offered, but the note from that catalogue is not included. Several extremely rare Shelley items which have been sold at Sotheby's, and to which important notes appeared in the catalogues are not found here, nor are the four extremely rare Frobisher items sold on March 16, 1907, included. The date of sale and catalogue lot numbers of the items quoted are given but the price is not. This information might have been included. The volume has as frontispiece a reproduction of a photograph of Sotheby's auction rooms during the first Amherst sale last December, with a key to important persons in attendance.

On May 24 and 25 the Anderson Auction Co. will sell a collection of books including a private library from Oregon. A copy of the first edition of "The Federalist" (1788) in the original boards, uncut; a first edition of Irving's "History of New York by Diedrich Knickerbocker" (1809), and Ethan Allen's "Reason the Only Oracle of Man" (1789), are the more important of the older books. Bancroft's "Poems" (1823); "The Offering for 1829," containing Emerson's first appearance in a book, the first copy to be sold at auction; a broadside poem of James Russell Lowell's (1858), unknown to bibliographers; several presentation copies of Thomas William Parsons's poems, and important first editions of Thoreau, Holmes, Whittier, and Bryant also appear. On May 26 and 27 the same firm will sell a collection of autographs and manuscripts, among them being several unpublished poems by H. D. Thoreau. On the evening of May 27 they will hold a sale of engravings, etchings, and original drawings.

On May 25-28 the Merwin-Clayton Sales Co. offers the library of the late Andrew Merwin, one of the founders of the company, who had previously served for more than thirty years with Bangs & Co., the old house of book auctioneers. Included are a collection of editions of Homer and books about Homer (59 lots) and a Dante collection (23 lots). Other notable books are first editions of Thoreau's "Week on the Concord and Merrimack Rivers" (1849) and "Walden" (1854); Whittier's "History of Haverhill" (1832); Emerson's "Poems" (1847), first edition, in the original boards with the label; publications of the Roycroft Press, books on folk-lore, books on natural history, etc.

On May 25 and 26 C. F. Libbie & Co. of Boston will sell the library of the late Prof. James Mills Peirce of Harvard University. A most important lot is the autograph manuscript of Benjamin Peirce's "History of Harvard University," including considerable material not in the work as printed. Professor Peirce was a friend of some of the leading writers of New England, and his library includes presentation copies of desirable first editions, among them Lowell's "Class Poem" (1838); Longfellow's "Hyperion" (1839); Holmes's "Autocrat of the Breakfast Table," large paper (1859); "The Guardian Angel" (1867), and "Urania" (1846).

Correspondence.

THE STATE OF THE DEMOCRATIC PARTY.

To the Editor of The Nation:

Sir: President Taft's political programme, although veiled by half-hearted denials, seems to include an attempt to break up the solid South, and should the undertaking succeed, its chief beneficiary would be the Democratic party. The greatest handicap to the success of real Democracy is that the aristocratic, labor-despising, and privilege-seeking South is depended upon to furnish the bulk of Democratic electoral votes.

I speak as a Democrat who wishes to see the party become what it ought to be, and what it must be, either to succeed at the polls or to exist as a strong opposition, viz: a sane and progressive radical party, standing for the same issues in every State in the Union, and not for a different issue in every State. It cannot attain that desirable condition now, because every intelligent voter knows that, despite platform declarations, it cannot carry out any measure of real or radical reform while the Bourbon South dominates its councils. The attitude of Southern Democrats in Congress on the tariff question makes clear as noonday what was sufficiently clear before. The hope of Democratic success lies in opposition to special privilege in every form, and particularly in a form so odious as protection; but when the leaders of the dominant faction in the party are engaged in a frank and disgraceful struggle for a share of the protective loot, it is futile to hope that sincere opponents of privilege will ally themselves with such an organization.

Stripped of non-essentials the chief political issue now, of which the tariff question is only a phase, hinges upon the unequal distribution of wealth. There is no escape from this issue, and the man is wilfully blind who persuades himself that the feeling of unrest which pervades the lower and middle walks of life is a temporary or ephemeral discontent. This feeling is certain to become more and more acute as intelligent minds inquire more closely into economic conditions which produce overgrown fortunes and squalid poverty side by side. What the ultimate outcome of the discussion of this many-sided issue will be no man can tell; but that it will certainly result in the withdrawing of every governmental privilege, whereby one man is permitted to appropriate wealth created by another, without rendering any return therefor, cannot be doubted by any person familiar with the history of the Anglo-Saxon people.

In such a political struggle as this issue involves, there is no room for two reactionary parties. The Republican party, by its more abject subserviency to any crooked interest that will contribute to its campaign fund, and by reason of its perfect organization, has preëmpted the so-called conservative ground. The Democratic party cannot outbid it for the support of the privileged interests, even if the rank and file of the party would permit such a bid to be made. Moreover, the Western Democrats, in the Roosevelt-Parker campaign, showed what their verdict will be when their party managers make what they regard as a bid for the support of monopoly. The Socialist vote in the West is growing because thousands of men who do not believe the visionary nonsense of Debs and his disciples, feel that they have no other ticket to vote. And the Socialist vote will continue to increase until the Democratic party offers a political abiding place to men sincerely anxious for economic reform. If the Democratic party were to do this, the Socialist party in the West at least would be reduced to a handful of half-cracked extremists, whose ravings would disturb nobody. Not only that, but enormous inroads would be made upon the Republican ranks, and thousands of votes would be secured from men who, while tired of corporate domination of the Republican party, now see no choice between it and the Democratic party.

But the Democratic party can hold out no hope to these thousands while Southern renegade protectionists, who are Republicans upon every vital political issue, except the negro question, are held up as Democratic leaders. So long as this condition prevails, the Democratic party can only continue to exist as a sectional party, without principle or conviction, and without the hope of gaining a single recruit. Parenthetically, I will say that I sympathize, in a general way, with the Southern attitude toward negro suffrage; but I protest against a condition which makes the Democratic party play second fiddle to Sambo.

It is a foolish waste of time to talk about building up a Democratic party in the West, except along radical lines, and under conditions which will eliminate not only Southern leadership, but a considerable, if disgusting, element of Eastern leadership as well. Western Democrats are not only weary of Bourbon control, but I think they have parted company finally and forever with Tammany Hall. Your Western Democrat is tired of seeing a blatant, cynical, and corrupt aggregation of political mercenaries coming in force to every national convention, arrogantly demanding platform concessions which will enable them to raise a corruption fund for their local purposes, and then returning home to trade off the national ticket for a New York Governorship. If the next national convention were to refuse to seat a single delegate from Tammany, on the broad ground that that such delegates are not Democrats, but political outlaws and guerrillas, it would mean a million votes to the party in the West and Middle West.

Two causes contributed mainly to Mr. Taft's majorities in the West last fall. One was an instinctive distrust of the ability of the heterogeneous mass calling itself the Democratic party to accomplish anything, if it were successful, and the other was a belief—a mistaken one, I think—that Mr. Taft represented the radicalism of Mr. Roosevelt. In saying this I do not wish to be understood as indorsing the Rooseveltian output of economic error and ignorance; but I say it to emphasize the fact that the West is definitely and permanently committed to radical political action. That radicalism, I hope and believe, can be directed along safe and wholesome lines, if the Democratic party proves sagacious enough to take advantage of its opportunities.

Western Senators and Representatives, who are standing out for high protection, particularly on raw materials, are misrepresenting their constituents; they represent merely the special interests to which they owe a prior allegiance. For example, the Spokane Chamber of Commerce memorialized Congress for a duty on lumber and lead ore. I am convinced that a plebiscite would show a majority of the people of this city of 100,000 or more inhabitants for free lumber and free lead; and I am morally certain that, were the immense farming districts of this section permitted to take part in the vote, the majority would be overwhelming, particularly for free lumber. A belief that the protec-

tive idea is fundamentally wrong, and that it is mainly responsible for the enormous cost of living, is growing rapidly all over the West, and several solons are due to learn this when they return from the present carnival of grab at Washington.

This letter is not the place to discuss all the forms which the struggle between democracy and privilege will ultimately take. The first battle will be over the tariff question, because protection is the most conspicuous atrocity within the present public vision. Upon that issue the Democratic party can win, because it ought to win; but it must first convince intelligent men that, in the event of victory, the fruits thereof are not to be surrendered by traitors within the camp.

Sectionalism, lack of any definite or coherent policy, indorsement of wild-eyed economic vagaries like Mr. Bryan's trust-regulation idea, and general political incapacity have combined to make almost a total wreck of the Democratic party; but enough remains to permit of a reorganization along broad, national, sane, radical, and progressive lines.

Permit a personal word in conclusion. I have voted four times for President—three times for W. J. Bryan and once for Alton B. Parker. I never did believe in free silver, nor do I believe now that the bank guarantee issue contains the essence of saving grace. But as a regular Democrat, a mere worker in the ranks, I claim the right to speak as one of the body of men who furnish Democratic votes.

JAMES F. IRBY.

Spokane, Wash., April 29.

THE SCIENCE OF SOCIOLOGY: A REPLY.

TO THE EDITOR OF THE NATION:

SIR: Nothing more truly amazing has appeared of late in the name of science than the article by Prof. Henry Jones Ford on "The Pretensions of Sociology" in your issue of April 29. When a whole class of scientific men, some of whom are as careful investigators and thinkers as American scholarship has produced, are attacked indiscriminately, they certainly have a right to demand that prejudice shall not be their judge.

In the first place, Mr. Ford does not distinguish between sociology and sociologists; nor does he distinguish these latter from social radicals and revolutionaries. All the plausibility of his argument is due to this confusion of the science and its votaries, together with the fact that he selects Spencer and Ward as typical sociologists, although their systems of sociological thought were formulated over a quarter of a century ago. There is scarcely one in the whole list of "established sciences" which has not in some stage of its development been exploited by quacks and visionaries. This is notably true of political science or philosophy, which produced a whole crop of dangerous radicals from Hobbes to Rousseau. At the present time, there is scarcely a mental healer in the United States who does not appeal to the science of psychology as the foundation of his art. Yet who would judge the science of psychology by such quacks?

As a matter of fact, very few sociologists of reputed standing endorse the revolutionary ideas which he credits all with possessing. Free love, trial marriage, divorce by mutual consent, the contract theory of society, and other anarchistic ideas, so far from being endorsed by a majority of sociologists, have, perhaps, been more powerfully combated by them than by any other class of scientific men. A few socialists and revolutionaries have put forward these ideas in the name of sociology, but not sociologists in the sense of scientific students of society. I challenge Professor Ford to name a single sociologist of standing who contends "that we should all be as free to find our affinities as cats or dogs"; or that "human beings should be free to mate as they please, and separate as they please, like other animals enjoying their natural freedom."

Even if the essence of Mr. Ford's criticisms holds as against a few individual sociologists of standing (and I admit that it does), still this should in no wise prejudice the question of the legitimacy of sociology as a science. What, then, is sociology? Sciences are distinguished by their problems, yet only a few sciences can be said to have a distinct field of their own. The same phenomena may be, and are, studied from many different points of view, or with reference to different problems, and different sciences result. Thus human society is the subject-matter of many different sciences, but none of these study it from the same point of view, or with the same problems in mind. Sociological literature from Comte down to the present shows that all sociologists worthy of the name have had practically the same problems in mind. These problems were set by Comte himself, viz., problems of the organization or order of society on the one hand, and problems of the progress or evolution of society on the other. The statement of these problems has been changed often by later sociologists by analyzing or breaking them up, and some have even added extraneous problems to the science; but with all sociologists of repute the problems of social evolution, on the one hand, and of social organization on the other, have been central. That is to say, human interrelations and their changes have occupied the attention of sociologists. Probably most sociologists to-day would say that they are studying the laws or principles of social change, and of social structure and function; or, to put it in still other words, they are investigating the origin, development, structure, and function of the forms of association.

These are not new problems in the history of thought, nor is sociology a new science except in the sense that it proposes to attack these problems by the new methods of positive science. Aristotle, Bodin, Hobbes, Montesquieu, Rousseau, and many others had more or less to say about these problems; but it was Comte's merit that he first definitely proposed to attack them by the methods of natural science, and he saw, too, that they belonged, not to politics, but to a science fundamental to all the special social sciences, which he named sociology. Yet, of course, even if Comte had never lived, there would still be a body of knowledge, or rather of theory, slowly becoming settled, which would correspond to sociology, though it might not have had this name. If there is any other science that has made these problems its main object of research, then the sociologist is perfectly willing to surrender his field; but, being interested in these problems, he is not willing to do this until he is shown that there exists such a science. Professor Ford implies that political science is able to take care of all the problems with which sociology deals. But I should like to ask him if a theory of society (human interrelations) is not quite different from a theory of the state or government? Most political scientists of the present are careful at the outset to distinguish between society and government, and say that their discipline is concerned only with the latter. In the past there have been political thinkers who have held to a contract theory of the state, but not of society. It would seem to be plain without argument, then, that the state is but one of many forms of association with which sociology may deal, but so important a form that it has developed a special science to deal with its many problems. To propose that this special science, political science, should reincorporate into itself sociology after the two have been differentiated is to propose that the historical process of increasing division of labor among the sciences should be reversed.

How, then, do sociologists propose to approach these problems of social change and social organization from the side of positive science? Simply by the use of the methods and principles of the "established sciences," especially of biology and psychology. In its more theoretical aspects, sociology is simply the biology and psychology of our social life, or, to be more exact, of the origin, development, structure, and function of the forms of association. Approaching its problems from the point of view of natural science and eschewing metaphysical principles, it could be nothing else. That sociology draws its principles of interpretation from other sciences is nothing strange, for this is true of many sciences. Physiology, for example, is nothing but the physics and chemistry of organic functions. At least this is the view held by conservative physiologists. What would be left of political science if one took from it history, psychology, jurisprudence, and, I may add, sociology? If it be claimed that the historical element and method give to political science its distinct character, then the same claim can be made for sociology, as Comte himself emphasized. If it be claimed that the subject of which political science treats is a unity and requires a unified science, then again the same claim can be made for sociology. The psychological and biological aspects of sociological theory by no means reduce that science to mere psychology and biology, any more than the psychology in economic theory reduces economics to psychology. Social evolution and social organization are unified processes, and a theory of social evolution and organization must take into account and harmonize both their psychological and biological elements.

Professor Ford adds to the speciousness of his argument by carefully selecting sociologists that are easy to criticise. He does not mention Tarde, Simmel, Barth, Ratzenhofer, Hobhouse, or Westermarck, but selects particularly Spencer and Ward as typical sociologists. Both of these men in their thinking were dominated by the

traditional English philosophy, with its materialistic empiricism and sensationalistic psychology. Both were at bottom anti-Darwinian in their views of life, and hence in their theories of society. Nearly all that Mr. Ford says in criticism of their sociological doctrines is entirely just so far as it goes, but he forgets to mention their really great services to the scientific study of human society.

Mr. Ford has his own sociological theories (as every thinking man has), and strongly implies that a correct theory of social evolution can be built simply upon Darwin's teachings. He seems to be unaware that the "massive parapets and bastions" of Darwinism have recently been shaken to their foundations, and that a theory of society built upon them (as many sociologists whom he neglects to mention have attempted) may be no more secure than other theories. The truth is, sociology and all the other social sciences must wait upon the development of biology and psychology; and these antecedent sciences are, even to-day, in an unsettled condition. How absurd, then, to demand that sociology shall have a settled body of theory, or else deny to it the name of science! None of the social sciences possesses a settled body of theory; and no one understands so well as the trained sociologist how perilous it is to dogmatize on social questions. Probably if psychologists and biologists were to express themselves on the questions of the day, they, too, would express themselves dogmatically, and I believe that about the same proportion of radicals would be found among them. While Mr. Ford is sure that "there is no such science" as sociology, and that "there is no basis for it as a science," still he stands almost alone in his dogmatism upon this matter. If any one is fitted to judge such a question impersonally, it is the workers in the other general sciences most closely related to sociology, viz., biology and psychology; and within the last dozen years biologists and psychologists have come to recognize very generally that there is a place for sociology. The lack of a clear field with a well marked boundary for sociology has produced various petty bickerings and jealousies between sociologists and workers in other social sciences. But in the very nature of things, as I have already pointed out, there can be no such clearly defined field for sociology. As a general science it will always be difficult to differentiate it clearly from the special sciences which labor in the same field. In this respect, sociology is not different from other general sciences. Biology cannot be easily differentiated from the special biological sciences; and but a few years ago some workers in these special sciences refused to recognize the existence of a general science of biology. Now, however, it is quite generally recognized that certain problems, such as the theories of heredity, of variation, of selection, and of organic evolution, cannot be adequately dealt with by the special biological sciences. If it is convenient and even necessary to recognize a general science fundamental to all the special biological sciences, it is even more necessary, it could easily be shown, on account of the menace of one-sided views of the social life, to recognize a general science fundamental to all the special social sciences.

Sociology, as a scientific endeavor, has had at least two distinct merits: first, it has stood for the natural science view of human society, which, traditionally at least, the special social sciences have not stood for; secondly, it has as a consequence emphasized the psychological and biological elements in human social life as primary, rather than the economic and political elements. Sociology has, on the one hand, stood for applying the methods of positive science to the problems of the social life; on the other, for obtaining an all-sided, comprehensive view of the social life as opposed to fractional or one-sided views. The scientific importance of this endeavor, it seems to me, cannot be overestimated. If the right development of the humanistic sciences depends upon getting rid of one-sided views of collective human life; if sociology is simply the name for the larger, completer view of the social life; if, finally, the social sciences can furnish man with the means of mastering his social environment, as the physical sciences have furnished him with the means of mastering his physical environment, then it would seem not unreasonable to say that he who opposes sociology as such is unconsciously an enemy of mankind.

CHARLES A. ELLWOOD.

University of Missouri, May 10.

HAMMOND LAMONT.

TO THE EDITOR OF THE NATION:

SIR: I cannot tell you how deeply I feel the death of Mr. Lamont. During these days since his death no one has *lived* so vividly in my consciousness. To me—and I think to many other young men who met him—he has always seemed a kind of inextinguishable centre of vitality, communicating energy to all around him. The virile gusto of his personality, his trenchant speech, even his quick, decisive walk had something inexpressibly animating and heartening in them. I can see him distinctly at his desk, bending over his proofs, and with his swift stride going past my door with copy in his hand, and in a dozen different distinct attitudes, and I think that power he had of making his presence felt, of etching his mere physical image on the mind, was the effect of an almost uniquely straightforward will and clean-cutting intelligence. To those who saw him every day, his death must mean just now an abrupt and tragical termination of his splendid activity, but here in the distance I try to think of him as having passed into the company of the swordsmen invisible who fight beside us and before us forever. STUART P. SHERMAN.

Urbana, Ill., May 11.

[From the many letters which have come to us we print this, as an illustration of the impression made by Mr. Lamont on one who worked beside him in these offices for a brief period.—ED. THE NATION.]

THE BIBLE AS LITERARY MODEL.

TO THE EDITOR OF THE NATION:

SIR: In the discussion of this subject, the *Nation* (April 8 and 29) and President Warfield seem to be talking at cross purposes. Whether the Bible is or is not a good literary model depends on how it is used. If one takes merely its literary form and seeks to imitate it by molding his own ideas into that form, it is a poor model, and your strictures are well deserved. The only objection to them would be that they do not go far enough. They should not stop with the Bible, but should condemn without stint the entire practice of using the Bible, or any other book, for such purpose. No literary excellence ever was, or ever will be, attained in any such way. We are too apt to think of style as wholly a matter of form, a quality of expression merely; whereas it is a quality of both form and substance, of both thought and expression; but primarily a quality of thought. It is only clear, vivid, and orderly thought that can give rise to clear, vivid, and orderly expression.

Those who can truthfully be said to have acquired the style of the Bible or of Shakespeare are only those who have acquired the ability to think and feel as the Biblical writers and Shakespeare thought and felt. For such thought and such feeling, the style of Shakespeare and the Bible is the best of models and the perfection of literary art, precisely because it grows naturally, and, we may say, inevitably, out of those thoughts and those feelings. When we read:

> Lord, Thou hast been our dwelling place in all generations. Before the mountains were brought forth, or ever Thou hadst formed the earth and the world, even from everlasting to everlasting, Thou art God—

or,

> Though I walk through the valley of the Shadow of Death, I will fear no evil; for Thou art with me; Thy rod and Thy staff, they comfort me,

we feel that these utterances are final. Why? Because they have come throbbing and burning from the depths of the soul, and are instinct with the life that gave them birth. They are a living and breathing entity, and their life and their style are one and the same thing. It is evident, therefore, that any attempt to use the Bible as a literary model by a servile imitation of its stylistic form must necessarily be futile.

But there is another and very different way of using the Bible as a literary model. It is to acquaint ourselves intimately, not only with its form, but with its subject matter; to enter into its spirit and see how that spirit, striving for utterance, clothes itself in language of power and beauty; and to become ourselves imbued with the qualities which are there exhibited. Chief among those qualities are clearness, force, directness, simplicity, sincerity, and loyalty to truth and righteousness. Now these qualities are not only the characteristic qualities of the Bible, but they are, also, the cardinal qualities of all literary excellence. Hence in becoming imbued with them, we are acquiring what is indispensable for any superior literary style.

When this method of use is followed, there seems to be no room for questioning the value of the Bible, as literary model, and no real disagreement between your views and those of President Warfield. And that there is no such disagreement is further shown by the fact, that the misunderstanding of terms is not confined to the word model, but

extends also to the word literary. Whether the Bible is or is not a good literary model depends not only upon the manner, as we have seen, but also upon the purpose, of its use; that is to say, upon the kind of literature sought to be thus modelled. For the literature of power, to use De Quincey's distinction, the Bible is the best of models; but for the literature of knowledge it is obviously no model at all. When you say that the Bible is not a good model for the kind of literature which is produced by "taking a vast and intricate subject having to do with public business, and tearing the heart out of it," or that which consists "in the orderly exposition of complex matters, in close and sound reasoning, or in accurate description," you are evidently dealing with the literature of knowledge, and the truthfulness of your assertion is manifest. But such writings do not belong to the kind of literature contemplated by those who extol the Bible as a model. With the manner and purpose of its use well understood, there can be little room for difference of opinion relative to the Bible as a literary model.

HERBERT L. BAKER.

Detroit, Mich., May 6.

Notes.

Beginning with this issue, the Nation *will be conducted by Paul Elmer More, for five and one-half years literary editor of the* Evening Post, *and since July 1, 1906, associate editor of the* Nation.

Harpers have brought out a two-volume edition of Motley's "History of the United Netherlands," which has hitherto been published in four volumes. The material is not abridged.

Charles Scribner's Sons announce that the translation of Professor Eucken's "The Problem of Human Life" will probably not be published until autumn. For immediate issue they have ready an important book by Major-Gen. A. W. Greely, called "Handbook of Alaska: Its Resources, Products, and Attractions."

Dr. C. W. Seidenadel has completed his study of the language spoken by the Bontoc Igorrote, and his work will be brought out at an early date by the Open Court Publishing Company of Chicago.

The entire library of the late Prof. Moritz Heyne of the University of Göttingen has been bought by the University of Illinois. It contains about 5,200 volumes on German literature and philology, and is especially rich in valuable editions of the sixteenth, seventeenth, and eighteenth centuries.

Dr. Oscar Levy, a German Jew, who lives in England as a prophet, so to speak, *in partibus infidelium*, preaching Hebraism and Nietzscheanism to the un-ideaed Anglo-Saxon, has at last arranged to bring out a complete and authorized translation of Nietzsche's Works in eighteen volumes. Those who regretted the premature conclusion of a similar project under the general editorship of Prof. Alexander Tille will be glad to know that the present undertaking depends on no commercial contract, and is in consequence likely to proceed to the end. The editor "has not," to use his own words, "entered into any engagement with publishers, not even with the present one" (London: T. N. Foulis), "which could hinder his task, bind him down to any text found faulty, or make him consent to omissions or the falsification or 'sugaring' of the original text to further the sale of the books." Of the four volumes of this edition now before us, one, "Beyond Good and Evil," translated by Helen Zimmern, was published two years ago by the Macmillan Co. as part of the ill-fated project, and is now taken over into the new edition. The three other volumes include "Thoughts Out of Season, Part I," translated by Anthony M. Ludovici: "Thoughts Out of Season, Part II," translated by Adrian Collins; and "The Birth of Tragedy," translated by William A. Haussmann. The rest of the eighteen volumes are promised before the close of 1910. To the undertaking in general we heartily wish success. It is high time that a man whose name is so bruited about the world were made accessible to English readers, and a somewhat cursory inspection of the volumes now issued indicates that the translations are at once faithful and easy. At a later date, when the more important works have appeared, it will be time to discuss the meaning of this Nietzschean vogue which has swept over the European continent. Meanwhile we would only intimate that Dr. Levy, who furnishes a thoroughly amusing general introduction to the series, might find a second cause for the slowness of the Nietzschean propaganda in England besides the Anglo-Saxon's imperviousness to ideas against which he rails bitterly. There is also a certain sanity in the English mind which feels instinctively that this boasted philosophy of strength is in reality a product of febrile weakness. The best paragraphs in Dr. Levy's introduction are those in which he draws a comparison between Nietzsche and Disraeli, but he leaves out of account the "English, all too English" source of Disraeli's ideas.

"Early English Romances of Love" and "Early English Romances of Friendship," done into modernized prose for the New Mediæval Library by Edith Rickert (Duffield & Co.), are the first two volumes in a projected series of four illustrative of the old metrical tales in English. The first volume contains "Floris and Blancheflour," "Sir Orfeo," "Lay of the Ash," "Launfal Miles," "The Earl of Toulouse," "Sir Degrevant," "The Knight of Courtesy," and "The Squire of Low Degree." The second contains "Amis and Amiloun," "Sir Amadas," "Athelston," "The Tale of Gamelyn," "Roswall and Lillian," and "The Story of Gray-Steel." Each collection is prefaced by an introduction giving the novice a bird's-eye view of the labyrinthine territory of romance, and some hints of the often trackless wanderings and foregatherings of Celtic, Classical, and Oriental stories. A handful of concise notes furnish necessary information and a guide to original texts and scholarly treatises without detracting from the pleasantly belletristic character of the work. Each volume, furthermore, contains a half-dozen excellent reproductions of the delightful old illustrations, which, together with the antique pigskin bindings, give the distinctive tone to this Mediæval Library and commend it to the bibliophile. If there is sufficient demand, it is proposed to offer in the third and fourth volumes specimens of the narrative of adventure and of the story with a moral. This division of the material to show different methods of treating the same theme is somewhat novel and suggestive, and, as the editing of the romances of love and friendship has been accomplished with discretion, it is to be hoped that the requisite encouragement will be forthcoming. It may be objected that any one interested in these dim, chivalric fictions may with slight effort master the difficulties of the original versions—which is true; but there are doubtless many readers who will find quite as much pleasure in Miss Rickert's oldish-flavored prose from which all difficulties have been removed. For on the score of style, as the editor acknowledges, the English metrical romances are not to be taken too seriously—"the story's the thing." In this day of more than religious regard for the sanctity of ancient texts, it is both shocking and refreshing to read Miss Rickert's confession that in translating "Amis and Amiloun," spoiled by the English poet's conventional repetitions, she has "thought it justifiable to limit the number of times in which he says the same thing." If a desire to allure the old-fashioned gentle reader is not wholly unworthy, we commend the license, and could even bear to see it extended. Indeed, we doubt whether any translator who holds timorously to the prolixity of these "old-wives tales," as the pioneer Ellis called them, will ever gain them as many friends from the laity as he gained with his high-handed abridgements and satirical analyses.

We do not know who can be the author of "Under Petraia, with Some Saunterings" (John Lane Co.). She prudently remains anonymous. But any one whose duty it is to examine her banal pages can easily reconstruct her. A British spinster, nearer sixty than fifty, who travels with a pet cat, a pet dog, a "tub," a hot-water bottle, and various "boxes"; who wears the heavy, clanking, gold bracelets which date from the early fashions of the "dear Queen" (Victoria); who read Ruskin in her youth, and has never digested him; who reads Pater's "Marius the Epicurian" (*sic*) now, not to mention J. A. Symonds and a Selwyn Brinton, by whom she sets great store; these and similar familiar characteristics the author of "Under Petraia" reveals to you as you read. She has evidently known a minor poet or two. She quotes occasionally a distinguished savant of the British Museum (now dead). It may be that her cousin married a prebendary. At any rate, she lets you infer that she has high acquaintances in Church and state. Some imp persuaded her that she has literary talent, and the result is a volume of dreary commonplaces, nay, intolerable, unless you take it as a revelation of the point of view, taste, and knowledge of that species which has for half a century packed the cheap *pensions* of the European continent. This particular specimen has had a villa outside Florence, which warrants her in dropping into bad Italian. But perhaps it is worth while to read a chapter or two of her book in order to learn to what a pitch self-conceit can mount.

Books on Italy multiply. The two latest volumes in the Mediæval Town Series (The Macmillan Co.) are "Milan," by Ella Noyes, and "Pisa," by Janet Ross. Both are much above the average. Miss Noyes shows here, as in her "Ferrara," an unusual ability to give an historic summary at once accurate, vivid, and interesting. In accordance with the purpose of this series, half of her book is descriptive of the present city, so that it may serve as a guide-book for strangers who want something more juicy than Baedeker. Milan played so large a part in Italian history from the eleventh century to the sixteenth that Miss Noyes's account of it is more than welcome. Mrs. Ross also is an experienced book-maker, and she does her duty conscientiously by Pisa. It is one of the defects of such a series, however, that the volumes must be of uniform length, irrespective of the importance of any particular city or of the amount of material about it. One feels, therefore, that Mrs. Ross has been obliged at times to spread pretty thin. Her three hundred pages devoted to the buildings and art prove that she has delved assiduously. Each volume has many illustrations. We are glad to see that the pen-and-ink drawings in vogue a few years ago, and borrowed from architectural designs, are going out of fashion. But why should books got up with so much taste as these be bound in so pale a blue that the gilt titles are illegible? That the title is meant to be read is a truism which no book-maker ought to need to be told.

The peculiar merit of "Daybreak in Korea" (F. H. Revell Co.), by Annie L. A. Baird, is that it is the simple story, by a woman, of her Korean sister's life in its phases of child-wife, widow, and slave. Though the leading character may be fictitious, yet all the facts and incidents narrated have come within the experience of the writer, and give a most vivid impression of the degradation and misery of the heathen peasant woman. The transforming power of Christianity and the happiness which it brings into these gloomy lives are so strikingly portrayed as to make the book a demonstration of the value of missions which cannot be gainsaid. Some interesting illustrations add to its attractiveness.

Many travellers in foreign lands write descriptive letters to their stay-at-home friends, but fortunately few of them are published in book form. The local newspaper is their usual depository. Occasionally one of them is more venturesome than the rest, and braves the publicity of print. Egypt is a country that lends itself quite readily to this form of exploitation, and a sample has recently appeared, in "From Cairo to the Cataract," by Blanche Mahury Carson (L. C. Page & Co.). Its alliterative title is untrue, as the start is made in New York. But the body of the book relates to the subject indicated. It is in the form of original letters, and gives a very good account of many of the things that one sees and experiences on the boat journey up the Nile and back again. One can easily imagine the nimble pencil of the note-taker and the industrious pen of the rehearser of information gathered indiscriminately from observation and from guide-books and histories. As a lively narrative of the doings and sight-seeing of a wide-awake American girl, the book is a success; and, as that is presumably its object, specific criticism may be spared. The forty-eight full-page pictures, almost all of them excellent, form its most valuable feature.

"The Black Bishop, Samuel Adjai Crowther" (London: Hodder & Stoughton), by Jesse Page, is the simple life-story, told mainly by himself, of a West African who was a kidnapped slave when a boy of fifteen and forty-three years later became the first negro bishop of the Church of England. The one aim of his life was to rescue his countrymen from the slavery of heathenism and to establish a native African church; and to him more than to any other single individual is due the present encouraging condition of the Nigerian provinces. For his labors were not confined to preaching the Gospel, but he did all in his power to encourage the native industries, his special interests being cotton-growing and the development of the palm oil trade, which he foresaw would in time eliminate the slave traffic with its train of hideous evils. Much information is given, beside the biographical details, about the problems presented by the Nigerian peoples to their white rulers and particularly of the extent, influence, and probable future of the Mohammedan invasion.

A new edition of the Abbé Loisy's "The Gospel and the Church" appears, with an introduction by the Rev. Newman Smyth (Charles Scribner's Sons). Dr. Smyth, as was evidenced in his "Passing Protestantism and Coming Catholicism," is a sympathetic, discerning, and thorough student of the entire Modernist movement, and in his brief introduction of thirty pages he seeks to commend Loisy as an historian and biblical critic, as a believer and as a Modernist Catholic. He urges that Protestants have much to learn from Loisy, especially from his chapter on Catholic worship, concerning which he says:

> It would be hard to find elsewhere an understanding at once so simple and so profound of the spiritual need of symbolism, or a truer historical account of the development of the worship of the Roman Church. Protestants may find suggestions in this chapter for the possible enrichment, without loss of spirituality, of their own devotional service. The time is indeed come when neither in Rome nor in Geneva is God to be worshipped; but in many ways, whether by symbols or by spontaneous words, or with symbols enriched by the best life of long ages past, God, who is spirit, is to be worshipped in spirit and in truth.

In a recent volume from the University of Chicago Press ("The Teaching of Jesus about the Future"), Dr. H. B. Sharman applies in a methodical, even businesslike, fashion Prof. Burton's theory of the literary relation of the Synoptic Gospels to the utterances of Jesus touching "the time subsequent to the final severance of relations between Jesus and his disciples." It is a carefully paragraphed essay in documentary criticism. The historical conclusions, though reached independently, are neither novel nor startling.

Professor Foley does not like Anselm's doctrine of the atonement, does not like the assumption that this Reformation dogma is the Catholic doctrine. The purpose, therefore, of his Bohlen Lectures ("Anselm's Theory of the Atonement," by George C. Foley; Longmans) is not a contribution to the study of Anselm's theory, though his exposition may be accepted as trustworthy, but an apologetic for the "earlier and juster views which prevailed in Alexandria and Antioch." While many Christians share with Dr. Foley and the numerous writers quoted in the appendix the feeling of repugnance to the Anselmic theory, they might at the same time think that this apologetic is directed against a man of straw. Had the author begun not with the Apostolic Fathers, but with Paul, the Epistle to the Hebrews, and John, and had he given a treatment of the New Testament evidence which revealed a clear understanding not only of Jewish sacrifices, but also of the significance of the sufferings and death of the righteous for the unrighteous, a treatment uninfluenced by later imperialistic and feudalistic conceptions, he would have furnished the reader with the best apologetic against the Anselmic and other unethical estimates of the value of the death of Christ.

A new series of biographic characterizations of those persons who at critical points in the history of Germany have played leading parts is now being published under the title of Deutsche Charakterköpfe: Denkmäler deutscher Persönlichkeiten aus ihren Schriften (Leipzig: Teubner). The editor is Wilhelm Capelle. The recent volumes are "Heinrich Pestalozzi," by Hermann Wolsemann; "Joachim Nettelbeck: Bürger zu Kolberg," by Max Schmitt-Hartlieb; and "Goethes Freundinnen: Briefe zu ihrer Charakteristik," by Gertrud Bäumer. The persons whose correspondence we find in this last volume are Cornelia Goethe, Susanna Klettenberg, Lotte Buff, Johanna Fahlmer, Lili, Charlotte von Stein, and fully a dozen other women who influenced Goethe. Perhaps the most interesting feature of this series is found in the fact that much of the contents of each volume is the *verba ipsissima* of the subjects themselves.

It is to be regretted that Christoph von Tiedemann, who died in 1907, was not able to write more than two or three chapters of his "Sechs Jahre Chef der Reichskanzlei unter dem Fürsten Bismarck" (Leipzig: S. Hirzel.) His son, however, with the aid of much correspondence from the Kanzleichef to his wife, has put together some 500 pages of reminiscence which is likely to interest most Germans, and which here and there will attract the foreign student of Bismarck and German politics of his time. There are some pleasant sketches, brief and cameo-like, of the master of Friedrichsruh and his favorite dog Sultan, which remind one of Motley's reminiscences, and some stories of Bismarck's sense of humor. Among the references to individuals of note mention is made of Caprivi, and it is clear that Bismarck but slowly and late came to appreciate the possibilities in that man. Perhaps the most interesting general reading is the narrative of the attempts, in 1878, to assassinate the German Emperor, and the reactionary effect that the affair had on the Chancellor. From that time, Bismarck sought to put his iron heel on the threatening Socialist.

About one hundred poems comprise the little posthumous volume, "Schein und Sein," from the pen of Wilhelm Busch, just issued by Lothar Joachim, Munich, and embellished with a portrait of the poet and an autographic reproduction of his manuscript.

So much of the correspondence between

the Humboldts and Goethe has never been found that Ludwig Geiger's collection of practically everything in hand up to date, together with critical notes (Berlin: Hans Bondy), should be well received. There are 118 letters exchanged between Goethe and Wilhelm and Karoline von Humboldt, and some twenty-one that passed between the poet and Alexander von Humboldt. This in itself is quite an addition to the 102 letters published twenty-one years after Goethe's death. An interesting fact revealed by the correspondence is the infrequency of writing, notwithstanding that Goethe once proposed to Wilhelm to send a letter once a month; and more astonishing, perhaps, is the infrequency of their personal intercourse. The Humboldts seldom came to Weimar, and they stayed but a short time when they did come. In addition to a good index, there are excellent reproductions in photogravure of the familiar Humboldt monuments at Berlin.

The educational work of a public library is well illustrated by the thirty-first annual report of Librarian W. E. Foster of the Providence Public Library, just issued. Significant is the fact that works in fourteen different foreign languages have been issued during the past year, the demands for books especially in Polish and Danish-Norwegian having greatly increased. An indication of the present trend of thought and interest is to be found in the statement that the largest additions to the library, 1,006 in number, have been books on social and political science. The next largest subjects were fiction and general literature.

The Académie Française has awarded the Grand Prix Gobert (9,000 francs) to Fortunat Strowski for his "Histoire du sentiment religieux en France au dix-septième siècle." M. Nouaillac receives the balance of the prize (1,000 francs) for his work on "Villeroy." The Prix Thérouanne (4,000 francs) is divided among M. Caudrillier, for his "La Trehison de Pichegru," and six others.

George Meredith died Tuesday morning at his home at Box Hill, near London. The immediate cause of death was heart failure. When he published his brief tribute to Swinburne, a few weks ago, few persons had any idea that it would be followed so quickly by the notice of his own death, although it was known that he had been in delicate health for some time and had already passed his eightieth year. His intellect had been so vigorous to the last that there was no sign of its approaching extinction. Only a few months have passed since he published a poem on Milton, which bore many of the most familiar characteristics of his thought and style. Of his early life but little is known except that he was born in Hampshire, on the 12th of February, 1828, and that he passed some of his early adult years in France and Germany. The influence of the literature of both countries bore fruit in his own work, but his especial genius was racy of the British soil. It was his original intention to follow the profession of the law, but it was not long before he abandoned his legal studies for the pursuit of letters. In 1849 he published a poem called "Chilllanwallah" in *Chambers's Edinburgh Journal*, and in 1851 he came before the public with a volume of poems, dedicated to his father-in-law, the novelist, Thomas Love Peacock. Then for several years he was heard of from time to time in various magazines up to 1856, when he printed his first prose work, "The Shaving of Shagpat, an Arabian Entertainment." This at once attracted attention by its fantastic imagination and the occasional brilliancy of its descriptions. It was followed in 1857 by "Farina" and other tales, and, in 1859, by "The Ordeal of Richard Feverel," which was to become one of the most widely known of his works. In 1861 "Evan Harrington" appeared, a book of a widely different character, founded upon the theme, "Can a tailor be a gentleman?" A year later "Modern Love and Poems of the English Roadside" came out and won the appreciation of connoisseurs by their intimate familiarity with country life. After this came "Sandra Belloni" (1864), "Rhoda Fleming" (1865), "Vittoria" (1866), "The Adventures of Harry Richmond" (1871), and "Beauchamp's Career" (1875). "The Egoist" appeared in 1879, and set the seal upon Meredith's reputation as a novelist. But this brilliant story, abounding both in the virtues and defects of the novelist, has also proved a bone of contention to the critics. Many there are who regard it as one of the greatest achievements of modern fiction, while others only find it inflated, laborious, and dull. "Diana of the Crossways" followed in 1885. His later works are: "Ballads and Poems of Tragic Life" (1887), "A Reading of Earth" (1888), "One of Our Conquerors" (1891), "Empty Purse" (1892), "Jump to Glory Jane" (1892), "Lord Ormont and his Aminta" (1894), "The Amazing Marriage" (1895), "The Tale of Chloe," and other stories (1895), "Comedy and the Use of the Comic Spirit" (1897), "Selected Poems" (1900). As a conversationalist Mr. Meredith was supreme, his wide wisdom, his native wit, and his quick perception helping the aptness of his argument and illustration. A writer said of him some years ago:

> He is a man of infinite polish of manner, and his conversational powers can best be described as charmingly garrulous. His most delightful hero has no more Chesterfieldian manners than has his creator. He is tall, slender to fragility, with a delicate cameo face and nervous alertness. He seems often to be living in a world of which his listener is no part, yet this never shows itself in any rude, apparent oblivion of his or her presence. His voice is one of singular magnetism. In another man it would be an affectation in its drawling tones, but it seems to belong to Meredith.

Charles Betts Galloway, bishop of the Methodist Episcopal Church South, in Mississippi, died May 12, at the age of fifty-nine. He had filled many offices of trust in the church, and at the time of his death was president of the board of trustees of Millsaps College and of Vanderbilt University. He was a voluminous writer. His published works include the following titles: "Life of Bishop Linus Parker," "Handbook of Prohibition," "Open Letters on Prohibition" (controversy with Jefferson Davis), "Methodism, a Child of Providence," "A Circuit of the Globe," "Modern Missions—Their Evidential Value," and "Christianity and the American Commonwealth."

From London is reported the death of the Rev. William Francis Henry King, best known for his dictionary of "Classical and Foreign Quotations." Mr. King, at first a clergyman of the Church of England, was converted to Catholicism and published a defence of his change in "The Church of My Baptism."

Albert Langen, the well-known German publisher and founder of *Simplicissimus*, has died at the age of forty.

THE AMERICAN REVOLUTION.

The Struggle for American Independence. By Sydney George Fisher. 2 vols. Philadelphia: J. B. Lippincott Co. $4 net.

A History of the United States and Its People. By Elroy McKendree Avery. Vol. V. Cleveland: The Burrows Bros. Co. $6.25 net.

Mr. Fisher's volumes are an elaboration and continuation of his "True History of the American Revolution," though so far reconstructed as to be, to all intents and purposes, a new work; while Dr. Avery's volume completes the first third of the great undertaking which he has long had in hand. Both are substantial additions to the modern literature of the Revolution, and although written in a popular style, everywhere give evidence of extended first-hand use of authorities. The wealth of illustrations which has distinguished Dr. Avery's previous volumes is continued in the present one, and with a skill in selection and perfectness in mechanical execution that are beyond praise.

Since both writers devote about the same amount of space to the period from 1760 to 1776, with which latter year Dr. Avery's narrative breaks off, a comparison of method and point of view is worth making. Mr. Fisher, as readers of his earlier volume might naturally expect, is sure that we have quite misconceived the nature of the Revolution, and that the historians, for various reasons, have failed to tell the whole truth about it. In his opinion, the colonies were not contending for undisputed constitutional rights of Englishmen, nor were they resisting tyrannical interference and oppression. The Revolution was not the result of "grievances," as that term is commonly understood, but of a demand on the part of the colonies for a political relationship which, while giving them all the protective benefits of connection with the mother-country, would at the same time leave them practically independent. What Great Britain was aiming at, on the other hand, was a thorough reorganization of its system of colonial administration in the interest of a broad imperial policy, with firm control of colonial affairs. That policy was entered upon, not by ignorant and irresponsible officials anxious only to make money out of the colonies, but by enlightened statesmen who understood, however imperfectly they may have applied, the correct principles of colonial government.

The weakness of Mr. Fisher's work at this point is its strident and even harsh assertiveness. His position is often quite as extreme as that which he combats. Doubtless the demand of the Americans for independence was a logical outcome of political ideas long nurtured, and not easily compatible with a theory of colonial dependence, yet it hardly follows that, in their reiterated protestations of loyalty to the mother country, they were framing specious and ingenious arguments to keep up appearances. It seems not to be realized by Mr. Fisher that men do not always see the end from the beginning, that the desire to make things hang together is strong wherever there is a developing system of law, and that use and wont are quite as powerful influences as logic in political action. It is by no means clear, notwithstanding Mr. Fisher's vehement contention to the contrary, that representation and taxation were not, in the eighteenth century, conjoined in the constitutional law of England, or that the consent of the colonies was necessary to the lawful exercise by Parliament of authority over them. The famous distinction between internal and external taxation, which he thinks never had a leg to stand upon, appealed to Franklin and Otis and to the first Continental Congress; while the English attempts at conciliation did not appear wholly unacceptable until after the declaration of independence.

Dr. Avery traverses the same ground, but his conclusions, though in the main the same as those of Mr. Fisher, are stated with noticeable moderation and restraint. His account of the constitutional dispute is concise and carefully phrased; for the most part, he sticks close to his documents, lets events speak for themselves, and avoids exhibiting motives and influences in a more striking light than they appear to have enjoyed at the time. Unfolding the same scheme of imperial development that engages Mr. Fisher, he can at the same time do justice to Bernard and Otis, Samuel Adams and Hutchinson, patriots and loyalists. From the purely literary point of view, this latest volume is his best; the style has greater evenness and dignity, and less of trivial digression and straining for popular effect, than in any of his earlier work.

To Dr. Avery must be awarded also the credit, no mean one in an historian, of greater carefulness, accuracy, and impartiality of statement; for Mr. Fisher, in spite of his extended citation of authorities, sometimes slips and sometimes appears to use only the facts that sustain his contention. Thus, the statements of Franklin and Washington, in 1774, to the effect that there was at that time no general desire for independence, are evidently regarded by Mr. Fisher as quite equivocal (Vol. I, pp. 208, 209). Otis's pamphlet, "The Rights of the British Colonies Asserted and Proved," which Dr. Avery (p. 49) thinks was intended "not to bring about a revolution, but to avert one," Mr. Fisher elects not to discuss. Of the Hutchinson letters he gives a ten-line summary, together with the single sentence: "There must be an abridgment of what are called English liberties" (Vol. I, p. 158); whereas Dr. Avery gives a fuller abstract and two connected passages.

Of the remaining topics covered by both writers, Mr. Fisher gives extended space to the loyalists, rightly holding the treatment of them by the patriot party as second in importance only to the prosecution of the war itself; and his account of the details of military life is both minute and valuable. Speaking generally, Dr. Avery, once the breach with Great Britain has opened, emphasizes the constitutional and political aspects of the struggle, while Mr. Fisher weaves into his narrative a greater wealth of picturesque incident. For the rest, Mr. Fisher's two volumes give a straightforward account of the war, fuller and better proportioned than that of Fiske, and entertainingly, if not well, written. There is less of novelty in the second volume than in the first, doubtless because the later period has been more carefully studied by others; and we merely note a judicious allotment of space to foreign affairs, the work of Congress, the campaigns in the South, and the negotiations for peace. In describing battles and military manœuvres, Mr. Fisher has some skill, notwithstanding that his imagination at times threatens to predominate over his facts. The wider relation of the war to Europe, India, and Canada also receives attention. The two volumes are fairly indexed, but for the index to Mr. Avery's pages we must, unfortunately, wait until the appearance of the final volume.

CURRENT FICTION.

The White Sister. By F. Marion Crawford. New York: The Macmillan Co.

It was a happy chance, or instinct, which led Mr. Crawford to return, in what was destined to be his last novel, to the field in which he had been most successful. Nearly half of the three dozen and odd romances which have been laid (according to the point of view) to his credit or discredit as the product of a much smaller number of years, deal with romantic episodes of modern Roman life. It is on this ground that his imagination plays most freely. Whether or not these animated figures are veritable Romans, born to the purple, they *are* animated, have the breath of life. Many of us followed the development of the Saracinesca series, number by number, with an interest almost breathless. "Sant' Ilario," "Don Orsino," "Casa Braccio," are still names to conjure with; and it is with an undeniable thrill of pleasure that we come upon a venerable member of that storied house playing an important part in "The White Sister." This is a son of Sant' Ilario, Monsignor Saracinesca—the young priest Ippolito of Corleone.

The most striking merit of Mr. Crawford's work was its directness. His style is simple to ingenuousness, even childishly direct and explicit. He is "the story-teller in the bazaar," determined, as his eye rests with kindly humor upon his motley audience, that every man jack of them shall know what he is driving at. By choice, he uses monosyllables, and one sentence runs into another with the fluidity of good talk. If he digresses now and then, he apologizes for the liberty like a gentleman, explaining the connection between the given comment and the story proper. To get ahead with the story, to make it intelligible, are his chief aims. He knows what happened: it is his business to tell it. He knows what happened!—that is the mark of the natural story-teller. It must have been a surprise to many of us to learn recently that Crawford, during years of hard journalistic service, believed that he had no natural power of invention. When he did begin to write novels, it was with a rush of energy, a direct vision of the events he wished to record, and an eager flow of speech about them, that gave the effect, at least, of improvisation. This seemed to him the right way, and he does not hesitate to express his impatience of other ways. The "white sister" is a Roman girl who becomes a nun after her lover is reported dead. Says Mr. Crawford:

> An accomplished psychologist would easily fill a volume with the history of Angela's soul from the day on which she learned the bad news till the morning when she made her confession and took the final vows of her order in the little convent church. But one great objection to psychological analysis in novels seems to be that the writer never gets beyond analyzing what he believes that he himself would have felt if placed in the "situation" he has invented for his hero or heroine. Thus analyzed, Angela Chiaromonte would not have known herself, any more than those who knew her best would have recognized her. I shall not try to "factorize" the result represented by her state of mind from time to time; still less shall I employ a mathematical process to prove that the ratio of dx to dy is twice x, the change in Angela at any moment of her moral growth. What has happened must be logical, just because it has happened; if we do not understand the logic, that may or may not be the worse for us, but the facts remain.

It must be admitted that the less said about the logic of the events in the present narrative, the better. Angela becomes Sister Giovanna, a nursing nun, dedicating her life quite as much to the memory of her lover as to the

service of God. He returns to life, and demands that she break her vows and marry him. She refuses, he kidnaps her, and tries threats as well as arguments to bring her to his purpose; but (although she is tempted) in vain. He finally restores her unharmed to the convent, and she determines to join certain of the sisters who have volunteered (practically suicide) for service in a leper settlement far from Rome. The mother superior of the order turns out to be her flesh and blood mother, and is heartbroken at the thought of her sacrifice. Still, she cannot advise a breach of the sacred vows. But at this moment the lover gets blown up, and refuses to have his life saved by the only possible means, unless the nun consents to petition for a release from the veil. This brings about an apparently final deadlock, which is, however, rather summarily and unexpectedly broken by Monsignor Saracinesca, who says that "there is a limit beyond which fidelity to an obligation may bring ruin and even death on some one whom the promises did not at first concern." He has (to put it vulgarly) a pull with the Cardinal Vicar, and can easily arrange the matter: and so it is arranged.

The finale is disconcerting. After a considerable struggle, the reader has just made up his mind that, the heroine being really a good deal of a saint, and the hero more or less of a cad, it is just as well that decency and order should not be annihilated to make two such lovers happy. Monsignor does not consent that the bonds of the church should be broken in the name of humanity and common sense, yet he permits the church to be bullied by what is virtually a threat of suicide. And yet one has somehow the sense that this is what actually happened, and that it was, on the whole, the most human and comfortable way out of a bad matter. In some such mood we have been in the habit of looking up from our periodical Crawford novel. We can but regret the stilling of a voice so manly, so simple, so debonnaire.

Katrine. By Elinor Macartney Lane. New York: Harper & Bros.

This posthumous book, graceful and charming as it is, will hardly add perceptibly to Mrs. Lane's literary reputation, which must henceforth rest upon "Nancy Stair," as it has done since the publication of that skilful bit of pseudo-history. The story, situations, and persons of "Katrine" are all well-worn. She is the beautiful and gifted daughter of a well-born Irishman afflicted with more or less intermittent alcoholism; and she loves and is loved by Francis Ravenel, a young Southerner, whose pride of race forbids him the thought of marriage with her. When he warns her of this, Katrine's love and pride are both outraged, and she goes abroad, after the death of her father, to forget Frank, and study singing with the great teacher Josef. We have also the familiar spectacle of another suitor, twice as worthy as Frank of the girl's heart, but utterly unable to obtain it. Of course, Katrine's ultimate capitulation at her lover's sick-bed has been a foregone conclusion since their first parting. We must repeat, that if Mrs Lane's name is to live among the modern story-writers, it must be for the sake of Nancy Stair, not for that of Katrine Dulany.

The Hands of Compulsion. By Amelia E. Barr. New York: Dodd, Mead & Co.

The persistent love of a lass of the Isle of Arran for a handsome, unsound-hearted lad, with her bitterly achieved cure, forms the nucleus of this story. But its best entertainment and workmanship lie in the surrounding circumstance of earth, air, sky, sea, and Scotch humanity. Annie's love is provokingly tenacious. The man she loves is exasperatingly inferior and motivelessly mean. But Annie's walk and talk, and Annie's father, with his Scotch austerities and mortal vanities, and Aunt Sarah's very human eccentricities and searching phrases are full of savor, breathing northern airs. There are other oddly fashioned characters, too, who weave in and out, more or less loosely, producing the effect of a fabric spun out by the yard rather than made into a garment of any particular shape. But it is a book of wholesome reading, breezy out-of-doors, and cosey within.

A Canyon Voyage. By Frederick S. Dellenbaugh. New York: G. P. Putnam's Sons. $3.50 net.

Sunset Playgrounds. By F. G. Aflalo. New York: Chas. Scribner's Sons. $2.25 net.

Next to the voyage of Columbus across the unknown seas, perhaps the most amazing feat of daring on record was Major Powell's first expedition down the Colorado River, in 1869; a journey on frail boats through a thousand miles of cañons created by a turbulent, foaming stream which, for long stretches, had carved its way more than a mile below the level of the surrounding land and was reported to disappear underground at some places. A graphic account of this thrilling ride was written by Powell and published by the government; but unforeseen obstacles had prevented the acquisition of the scientific data desired. To secure these in the light of the former experiences, Major Powell undertook a second expedition, better equipped, in 1871. Of this exploring party, Mr. Dellenbaugh became a member, "by great good luck," as he puts it, scores of men being turned away disappointed; and, in the present volume, which is none the less valuable for being so belated, the author gives a vivid account of the experiences and hair-breadth escapes on this second voyage. A synopsis of the trip was printed in his "Romance of the Colorado River," but the complete story is now told for the first time. Major Powell himself exhorted him, several years ago, to write this fuller account, and in complying with this request, the author had the privilege of using, not only his own notes, but the diaries of several other members of the party.

It was decidedly worth writing, this detailed record; a more absorbing, and at times stirring, story of adventure has not seen the light in a long time, and the author's unadorned, yet vivid, style enables the reader to share all the emotions of the explorers. When they started, at Green River City, Wyoming, not a single settler lived on or near the river for a distance of more than a thousand miles. The whole region was a howling wilderness, peopled here and there by a band of Indians, whose intentions might or might not be friendly. The cliffs that walled in the river were unscalable almost the entire way; and what made the situation particularly hazardous—even more so than the voyage of Columbus—was that once the trip was begun, there was no possibility of returning. For that the river was too swift, the rapids too frequent. There were days when, after Herculean labors in lifting boats, climbing over gigantic boulders, tugging, pulling, shoving every minute, only a mile or two of progress was made. There were places where a successful run of the rapids would take two minutes, while a "let-down" would occupy as many hours. But was the run safe to risk? That question confronted them almost constantly, and the decision usually had to be instantaneous. The major was always on the outlook, but because of incessant changes in the bed of the stream, his memory of the first trip was not of much service. Once the major exclaimed "By God, boys, we are gone," but they pulled through. Another time, they were all spilled in the foaming water, and what happened then, it takes the author several pages to tell.

These men had big appetites, with little to eat; they slept on sandbanks, glad if they could find a few willow twigs to put under their backs; they had adventures with Indians, Mormons rattlers, scorpions, wolves; they hunted deer and mountain sheep; they heard wonderful echoes and uncanny noises; they came across relics of cave dwellers and the wreckage of luckless boatmen; they saw cañon cliffs simulating every known style of architecture; and they took a large number of photographs,

many of which are reproduced in Mr. Dellenbaugh's volume, and make the reader eager to take the next Santa Fé train for Williams, Arizona.

The Grand Cañon was the one big thing the author of "Sunset Playgrounds" missed, and afterwards everybody told him, "Why, you haven't seen America!" He did, however, see southern California, the Yosemite, Tahoe ("the loveliest lake I ever dropped a line in"), San Francisco rising from the ruins, Portland, Seattle, and all the interesting things Canadian between Vancouver and Montreal. He is an Englishman who travelled seven thousand miles to catch a tuna, and never got sight of one; yet he is anything but sorry he made the trip. He tells his countrymen, as one who has had wide experience, that for all game fishes except salmon "America is without a rival"; and he tells those Britons who have only a month's holiday that, though half of their vacation may go in the round trip, they will get more fish in the remaining half than in the whole month at home, while the cost is about the same as the rental of first-class water in Scotland. Canada offers the largest opportunities, but the fisherman's paradise is Catalina Island, thirty miles off the coast of California. Here Mr. Aflalo had the time of his life, enjoying "the finest sea-fishing in the world."

The Ancient Greek Historians. By J. B. Bury. New York: The Macmillan Co. $2.25.

Professor Bury's Harvard lectures on the Greek historians are well suited to their purpose by their lucid and readable style. But, in substance, they are rather the running commentary of a professional and up-to-date historian than illuminating literary appreciations of the great writers with whom they deal. He is chiefly interested in points of his own overlooked by the Germans, or in the newest *geistreiche* combination of Wilamowitz, or the latest papyrus find. But we do not wish to censure the author for not doing something that he has not chosen to do. We merely note, in passing, the tendency to transfer the idea of progress from the physical to the historical sciences, and the consequent failure to distinguish with sufficient sharpness between the fashions and conjectures of the temporary leaders of scholarship, and the abiding body of tradition. This said, it remains only to enumerate the chief topics and suggestions of Professor Bury's interesting volume.

The critical and rationalistic spirit of Ionia evolved history out of the genealogical, local, and geographical epic. The "father of history" was Hecatæus of Miletus, who, "we may pretty confidently assume," was the source of Herodotus to an extent that Herodotus himself does not recognize—but Professor Sayce does. The last three books of Herodotus were composed first, as R. W. Macan has made clear, probably in the years 456-445, before the travels in Egypt and Babylonia. The account of the Persian wars was, "we may conjecture," an answer to the challenge of the Ionian λόγος of Dionysius of Miletus, in which the Ionians were shown in a more favorable light and Athens played a less brilliant rôle. Otherwise what chiefly interests Mr. Bury in Herodotus is his critical spirit—the precise limits of his skepticism. Incidentally the Greek idea of the jealousy of the gods is banished from its last refuge. The ordinary Greek attributed to his gods not only Nemesis towards the prosperity of the wicked but jealousy of all human eminence. Plato, followed by Aristotle, protested that "envy has no place in the guise divine." But what of the fifth century writers? It has for some time been the fashion to argue that Æschylus outgrew the idea on which the Prometheus is based, and that the chorus of the Agamemnon repudiates it. The late Prof. James Adam, in his "Religious Teachers of Greece," tries to show that Pindar had outgrown it, and now comes Mr. Bury and tells us that "the catastrophe which befalls the Persian expedition is not conceived as the work of jealous gods, annoyed by the conspicuous wealth or success of mere mortals."

Ample justice is done to Thucydides as the founder of political and critical history, and the first practitioner of the archæological method. No part of the history was published until after the year 404 B.C. When the preface to the fifth book was written, the significance of the entire war was first revealed to the author, and he decided to combine in the artistic unity of the whole his separate studies of the ten years' war, and the Sicilian expedition. An entire chapter is devoted to the speeches with the strange omission in both text and bibliography of all reference to Jebb's masterly essay. The chief new suggestion, if it is one, is that the contorted style, which is not found even in all the speeches, is a hint to the reader that Thucydides is setting forth his own reflections with all the art which he had learned in the school of Gorgias or Antiphon. The application of this criterion yields the conclusion that the "Epitaphios" is not even in substance the utterance of Pericles, but embodies Thucydides's own psychological study of the Periclean régime and its lofty but impracticable ideal. Even if we concede this, it is surely fanciful to see an oblique sneer at Periclean idealism in the words attributed to Cleon in the Mytilene speech long after Pericles's death: ζητεῖ ἄλλο τι ὡς ἔπος εἰπεῖν ἢ ἐν οἷς ζῶμεν, which Mr. Bury thinks are the exact Greek equivalent of "he is an idealist."

A brief chapter on Roman historiography and some observations on the philosophy and uses of history conclude a volume whose value for all students of the Greek historians is in no wise affected by these minor criticisms which we have thought more profitable than the indiscriminate praise usually awarded to writers of Professor Bury's eminence.

The Precinct of Religion in the Culture of Humanity. By C. G. Shaw. New York: The Macmillan Co. $2 net.

Professor Shaw's object is to prove that religion is independent of science and philosophy. In this position he falls in with one direction of current thought as represented by Edward Caird and other writers. Religion, he holds, is religious consciousness, it is the self-affirmation of the soul, it turns in despair from the imperfections and contradictions of the world to seek satisfaction and peace in a divine order that offers an adequate aim for life, and in a divine person who gives reality to the world; "what genuine religious thinking demands is a universal realm in which the supremacy of God and the destiny of man may live in eternal communion" (p. 218). This is merely an elaboration of the definition of religion—religion is faith in an omnipotent righteous ruler of the world. Professor Shaw, however, goes a step farther, and ascribes to religion the power of creating ideas. "The testimony of philosophy," he says (p. 56), "seems to be that it is from religion and from religion alone that we have obtained just these three all-important ideas of a personal soul, the unity of the world, and the absoluteness of the world-soul," and he adds: "It is from religion that our philosophy has received its idea of the soul." He should rather say that it is religion that gives these ideas their noblest form. It is in such statements as those just quoted that the logical defect of the work lies. While its spirit is admirable, its learning competent, and its philosophical, social, and historical criticism suggestive, it does not clearly distinguish between creation and adoption—it represents religion as originating what it only accepts and defines. The soul has always been known to man through his ordinary experience—religion invests it with dignity by making it the friend of the Deity. The unity of the world is a philosophical dogma—religion makes it instinct with spiritual life. Belief in the absoluteness of the world-soul might exist without religion, but religion tinges it with emotion and makes it a practical element of life. Religion is not the only form of thought that is dissatisfied with the world—ethics seeks to improve human conduct, Socialism looks to an

economic reconstruction of society. Religion differs from these not in seeking something better than now exists, but in the source to which it looks for betterment. Possibly Professor Shaw has these points in mind, but he does not make them clear. His interesting work would gain in effectiveness by emphasizing the fact that religion is an attitude of mind, and that its doctrinal content—the soul, the world, God—comes by the ordinary processes of mind.

Behind the Veil in Persia and Turkish Arabia: An Account of an Englishwoman's Eight Years' Residence amongst the Women of the East. By M. E. Hume-Griffith, with Narratives of Experiences in both countries by A. Hume-Griffith, M.D. With 37 illustrations and a map. Philadelphia: J. B. Lippincott Co. $3.50 net.

Like Dr. Wishard's recently published "Twenty Years in Persia," this work is the record of a physician's intimate personal experience among Persians of all classes. The story is not a new one, nor a very important one, but it has the vital interest which belongs to all faithful transcriptions of human life. It is, moreover, a sad story, as that of the physician is likely to be. This should be remembered by the reader; for what the physician sees behind the veil, while true, is not the whole story. Many of the incidents related would seem incredible to the stranger to Eastern manners and customs were they not the narrative of an eye witness. The pitiful hardships of child labor in the carpet-weaving districts, the barbarous practices of Persian medicine and surgery, the cruel punishments of Persian justice, the rapacity and extortion of the mullahs, the degraded lot of woman, whose birth is regretted, whose death is unmourned, and whose life is a literal slavery to the pleasures and necessities of an absolute master—all these are facts, and they, rather than the brighter aspects of life in the East, which are quite as real, form the burden of the narrative. In this respect Mrs. Hume-Griffith's book, for her share in the authorship is the larger, compares unfavorably with that of Dr. Wishard, who, perhaps because of his longer residence, sees the good and hopeful which exists in the Eastern character.

There is no pretension to literary quality or learning, the chapters succeeding each other like a series of letters written to friends at home. But they afford interesting pictures which contribute to the general understanding of social conditions in a portion of the East as yet scarcely touched by Western influences. The illustrations are more than usually striking, being evidently drawn from other sources than the common stock from which the traveller ordinarily obtains his supply.

Science.

A Naturalist in Tasmania. By Geoffrey Smith. New York: Henry Frowde. $2.50.

This book is the result of an expedition which was undertaken especially to study the fresh-water life of Tasmania, and for which a grant was made by the British Association for the Advancement of Science. The first chapter introduces the reader to the early explorers, Dutch, French, and English, of the island at the extreme south of Australia. The account of the Tasmanian aborigines is particularly interesting, because, from their low state of culture, they have been regarded as extant survivals of paleolithic man. The other implements which they used, besides wooden spears and clubs, were roughly chipped stone scrapers, true paleoliths, without any attempt at grinding or polishing of edges. They knew how to make fire by twisting a pointed stick upon dry tinder in a hollowed-out piece of wood. They had the custom of our American aboriginal Indians of burning the forests to clear out the underbrush and to form grassy clearings or meads; and they knew how to entice to feed therein the kangaroos and other game. They ate shell fish and cray fish, the eggs and flesh of the mutton-bird, or sooty petrel (*procellaria*); the roots and shoots of ferns, seaweeds, and fungi. They had also so far acquired that especially Southron-American taste which President Taft has lately popularized, that they ate opossums ("'possum") and other native marsupials. Little is known of their religious opinions, though they seem to have believed in evil spirits, whether they did in a supreme Being or no; and they probably believed in a future state. The Quaker missionaries, Backhouse and Walker, when visiting a remnant of the tribes, saw an old woman placing together sundry flat stones marked variously with black and red lines. These, she explained, were her country people absent from her. Unwilling to refer to them as dead, she spoke of them as "plenty far away." Thirty years ago this interesting and unfortunate race became extinct. It was the old story of the effect on primitive tribes of close contact with the European. Imported diseases, vices, race hostility, and pernicious liquors wrought degeneration, and finally death. The last of the pure-blooded Tasmanians, named Truganini, died in 1876. Her mother was murdered by sailors, her sister was carried off by sealers, she herself was originally kidnapped, and her lover murdered by two sawyers in the government employ. And her complete skeleton is now preserved in the museum at Hobart.

Following these introductory accounts, the author takes up the story of the fauna and flora of the island. These he describes with considerable fulness, and in a thoroughly scientific, though popular, manner. In other words, he does not burden his narrative with technical terms and details of interest to specialists alone, but gives the results of his observations of trees and shrubs, birds and wild beasts, fishes, reptiles, and crustaceans, mountains, lakes, rivers, and natural scenery, in a style so plain and graphic that the intelligent lay reader follows him with great pleasure, as well as advantage, and the trained naturalist with equal satisfaction and enjoyment. The book is richly illustrated by numerous drawings and photogravures; and an excellent map of the island presents its geological features and physiography. One rises from the reading of this admirable book feeling that the author has kept faith with one, and has given a good view of Tasmania and its natural characteristics.

A School of Forestry has been opened at Oxford, England, in the new Forestry building erected by St. John's College, at a cost of over $50,000, for the use of the university. The event marks an advance in the development of studies in rural economy which will be of great practical benefit both in England and India. Rider Haggard was one of the speakers at the dinner given in connection with the opening exercises.

H. W. Wright's "Birds of the Boston Public Garden" (Houghton Mifflin Co.) is clear evidence of the ever-widening interest in birds. Not many years ago publishers brought out only general works on natural history. Then came the day of animal and bird books, and now we have embodied in a well-made volume the notes of eight seasons, relating only to the migratory birds observed in a twenty-four-acre oasis, situated deep within the desert of a city's streets. Naturally, one must be a Bostonian to get full measure of value from these records, but the perseverance and enthusiasm of the author cannot fail to inspire bird-lovers in other cities and places. In the first part of the book Mr. Wright gives a concise description of the Public Garden, and outlines his results. His record day for number of birds during the eight years was May 12, 1908, when 137 individuals of 28 species were observed. Three-quarters of the book is devoted to a list, well annotated, of 116 species of American birds, two introduced species, and two probably escaped from captivity, all of which were observed within the Boston Public Garden. It constitutes a remarkable record of thorough observation in a very limited area.

Drama and Music.

Three new volumes bring the issues of the Tudor Facsimile Texts to an imposing number. One of the new volumes is Ulpian Fulwell's "Like Will to Like," reprinted from a copy of the edition of 1587 in the British Museum. The only other copy of this edition known to exist is one

tbat turned up in the Mostyn sale at Sotheby's in 1908. The British Museum copy is ratber badly smeared, and the reproduction brings out tbis fault, as it does all others. J. A. Herbert of the Manuscript Department of the British Museum, who is comparing all these reprints with great care, says that tbe stained pages are even a little worse here tban in tbe original. Anotber volume contains the "Nice Wanton" from a copy of tbe earliest known edition (in the British Museum) of 1560. The Interlude has already been issued in this series, reprinted from tbe edition of c. 1565. Tbe two reprints thus offer an interesting field of comparison. Amon~ other things, the cop of 1565, by tbe excellence of its text, proves the wisdom of the British Museum authorities in purchasing the rare books of tbe "Irish find" of 1906. Mr. Herbert reports the present reproduction as "generally excellent," and the good results of using a harder, smoother paper for these reprints will be seen by comparing this volume with tbe earlier facsimile of the same interlude wbich was sent to subscribers in 1907. The tbird volume now issued contains "Youtb" in two forms: one from the Lambeth Palace fragment, of a date not earlier tban 1528, and the other from tbe Waley edition of c. 1557. These two, witb the reprint of tbe Copland edition already issued in tbe series, comprise all the known impressions of this curious and interesting interlude. Here again opportunity is afforded of making an instructive comparison of texts. These volumes, like all tbe earlier issues, are edited by John S. Farmer, and published by T. C. & E. C. Jack of London.

Tbe celebration at Rome of the eightletb birthday of Tommaso Salvini, deferred from New Year's in consequence of the earthquake, began on the evening of Aprll 29 wlth a special performance in the Argentina of Sebatino Lopez's "Buona Figluola," followed by a recital of Dante's "Deatb of Count Ugolino," by the actor's son, Gustavo Salvini, and tbe presentation of commemorative wreaths and parchments by his fellow actors. At the Campdoglio, the following day, Mayor Nathan, in behalf of the city, presented a medal recording Salvini's share in the defence of the Roman republic of 1849, and the King conferred on him the order of the Crown of Italy. A gold medal struck in his honor by Queen Margherita and gifts from Trieste and the chief cities of Italy were announced. In this connection mention should be made of two recent publications, "Vita aneddotica di Tommaso Salvini," by Jarro (Giulio Piccini), and "Tragedia e Scena dialettale," by Antonio Russo Ajello, a study of Salvini's art and its influence on the contemporary Italian stage.

H. B. Irving has been talking to the Pen and Palette Club in London on the Shakespeare Memorial Theatre scheme. In the course of his remarks he said that any scheme for a national theatre which did not fall into practical hands was foredoomed to failure. The plan, as put forward, was, he said, full of elaborate proposals. For instance, the governing body of the theatre was to be a council and standing committee composed of representatives of the universities, the Royal Academy, tbe County Council, various municipalities, the high commissioner of the colonies, and a few others. What could such a body have to do with the control of a national theatre? Why should the theatre, as though it were a dangerous lunatic, be considered incapable of looking after its own affairs? No one could wish more keenly than he did that they might have one day a great national theatre, but let them see that the theatre did not become a prey of faddists and amateurs.

Beerbohm Tree will produce in London tbe Beethoven play, of M. Fauchois, which was so well received at the Paris Odéon. Louis N. Parker will make the English version for him. Beethoven is shown in his later years, the climax of the second act belng reached at the moment when he suddenly becomes stone deaf. The third and last act ends with his death, an event immediately preceded by a vision, in which the dying composer is surrounded by living realizatlons of his "nine symphonies." "Beethoven" was praised highly by the Parisian critics, and is said to be one of the pieces selected for representation by the New Theatre in this city.

Bayreuth is to retain its monopoly of "Parsifal," the association of German operatic managers having agreed unanimously not to stage this work as long as the Bayreuth festivals continue.

The Finnish Senate, which has power to award each year prizes varying from $300 to $1,200 to authors and artists, has this year voted an annual life pension of $1,000 to Finland's foremost composer, Jean Sibelius.

Tbe extraordinary difference between operatic conditions in Milan and New York is illustrated by the fact that during the past season the two operas most frequently sung were Spontini's "La Vestale," wbich had sixteen performances, and Giordano's "Andrea Chenier," which had twelve. Giordano's opera failed to please New Yorkers, and if Spontini's old-fashioned opera were revived here, it would probably have a run of one consecutive nigbt. Strauss's "Elektra" was sung only six times.

Since no novice finds it more difficult to get a hearing than the young composer of orchestral music, the national competition for a new orchestral suite or a symphonic poem, just announced by the Roman Society of Autbors, contains the commendable provision that the successful composition shall be performed during the season of 1909-10 at one of the sympbony concerts given in tbe Anfiteatro Corea. As these concerts are supported jointly by the Royal Academy of Saint Cecelia and the city of Rome, it is fitting that the responsibility of these bodies for the advancement of Italian music should be recognized in this way, as well as by the formation of competent interpreters—a service they have shown their intention of performing by appointing as director for a single concert each season one of tbe youngest of Italian musicians, Vittorio Gui.

Prof. Julius Hey, the well-known German music-teacher, has died at Munich in his seventy-seventh year. He had assisted Wagner in bringing out "Tristan und Isolde," the first time in Munich, and had instructed a number of the best Wagnerian singers.

Art.

THE ROYAL ACADEMY.

LONDON, May 1.

Innovation of any kind comes as a surprise at the Royal Academy. The fact that two hundred fewer pictures have been hung this year, and that, in consequence, a narrow strip of wall space is left bare below the ceiling, would seem almost a reform, if the reduction in quantity meant a corresponding improvement in quality. But though the little bare strip of wall space is much to be thankful for, the standard, as far as the pictures are concerned, remains the same, and the hanging below the strip as unintelligent. It is really extraordinary how faithful the Academy is to its own level of dulness.

The truth is that, for art as for literature, the present moment is one of commonplace, and it is inevitable that this should be felt above all in an institution as vowed to commonplace as the Academy. The exhibition at Burlington House has never been of artistic importance during the twenty-five years I have been going to it regularly every summer, but it is now, if anything, more unimportant than ever. That the older Academicians, men like Poynter, Tadema, Dicksee, Fildes, Herkomer, should continue to turn out very much the same pieces of Academic correctness and archæology and sentiment and prettiness and commonness, is only natural. But I find that even some of the younger members, whose work, in its freshness, was once a pleasant contrast to the prevailing monotony, have fallen into the Academic fashion of repeating themselves until they, too, are in danger of preferring formula to Nature. There was a time when Mr. Clausen's pictures attracted attention, though they might not be masterpieces, by his unmistakable effort to work out some problem of light or atmosphere. But his problems are becoming stereotyped. For the Diploma picture which the newly elected Academician must present to the Academy, and which he is now showing, he has painted the "Interior of an Old Barn," as he has more than once before and under much the same conditions. In another painting he has placed an "Old Reaper" in the landscape and under the sky he has of late years made so familiar; and it is only the master like Corot or Millet who can go on repeating the same subject and the same treatment without growing stale. In a third, "Late Moonrise" has given him a new theme, but it seems to have bewildered him, as if he had no longer the eye for new problems, and the landscape is filled with a light that never shone except on his small canvas. Mr. Edward Stott, an-

other exhibitor who for long claimed and repaid attention, is apparently conscious of the danger of repetition, but strives to escape it, not by closer and more intimate study of Nature, but by anecdote, which is much more in favor with the Academy's public. At first, he endeavored to put down simply what he saw—Nature in her tranquil moods, a quiet stretch of fields or heath, a low range of hills, a country lane, the people who belonged there as they came and went on their daily tasks, if they happened to give just the necessary touch of space or color. He invented nothing in the way of subject or detail, seeming to know that the beauty was in the mystery of dawn or dusk, in the harmony of tone or the rhythm of line. But now he must arrange the figures in the landscapes and give them an artificial value, and he brings together a woman and her child, a sheep and its young, and calls his picture "Two Mothers," that it may please the many who revel in sentiment; or else he makes the twilight gather upon The Flight of the Holy Family through a lovely landscape to which they have no real relation and where they only keep you from seeing how tenderly the shadows envelop the hills beyond, how quietly the light fades from the evening sky. And so it is with many other of the younger men, inside and outside the Academy, who keep on painting again and again practically the same picture that has brought them popular success or official recognition.

The Academy may have been a warning signal to Mr. Sargent and helped him to his decision to paint no more portraits, though he, better than any painter there, could afford to run the risk of repetition. However, his portraits recently have shown the strain of years of portrait painting, and certainly there is nothing in the two he exhibits this summer to make one regret his decision. In his three-quarters length of the Earl of Wemyss, who stands, his full face looking straight from out the canvas, the figure in the black frock coat is so elongated and the head, with the white hair and white fringe of whiskers and the extreme pallor of the complexion, is so overemphasized, that the effect is very close upon caricature.. It is much more interesting to turn to his large decorative design, Israel and the Law, destined, I believe, for the Boston Public Library, where I should like to see it before pronouncing any but a very tentative opinion. At the Academy, it hangs in the midst of restless portraits and vivid landscapes, whereas it is intended to become a part of a definite architectural design, with no paintings near except, perhaps, others in the same decorative scheme. As it is, in its Academic setting, it has dignity and grandeur. A great shrouded, seated figure fills the centre of the composition, the pose vague and confused, but impressive; between the knees, in the shadow of the massive drapery, a boy crouches; and on either side are three other figures, each holding a golden sword. The masses are well balanced, and the figures sculpturesque in feeling. The group, rose and gray in color, the lines following the line of the lunette it fills, is bound together by the long flowing curves of a golden scroll, and set against a background of flat blue with a border of golden Hebrew characters placed and spaced so as to yield their full decorative value. There is no other design at the Academy, however large or for whatever purpose, that can compete with this. It would be subjected to a more severe comparative test at either Salon, where there are painters who have had the advantage of the same sound technical training, and the benefit of commissions as important, and who are not afraid of hard work. Commissions for mural decoration are rare in England, and, as a rule, the Academy is the last place in which such work, when done, is exhibited. At the Royal Academy banquet last night, Sir Edward Poynter referred with satisfaction to the fact that the walls of St. Stephen's Hall at Westminster are to be decorated, but few British artists of to-day have revealed the least fitness for the task.

Mr. Abbey, probably still busy for Harrisburg, has nothing this year, though his followers do their best to take his place. But, as a rule, the pictures based upon some incident in history or mythology, or inspired by some unwonted flight of the painter's imagination, smell so strong of the studio that they scarcely seem worth criticism.

The portraits are numerous, but those that call for a second glance are few. Brutality of paint answers for character in the sitter, discordant detail passes for arrangement. The presentation and official portraits by Academicians and Associates hang in greater numbers than usual. The Prime Minister and the Chancellor of the Exchequer in robes of state, Indian princes in gorgeous silks and jewels, John Burns and the Duke of Northumberland, a long succession of men, famous or notorious, stare at you from Academic pomposities on the line, but hardly one deserves as much as a word in passing. J. J. Shannon's most important canvas is a group of three sisters, Frances, Dinah, and Kathleen, daughters of Francis Tennant, Esq., which, unfortunately for himself, invites comparison with Mr. Sargent's group of three sisters hung in precisely the same centre a very few years ago. Mr. Shannon would do well to find another sitter like Phil May, to serve as tonic after his long surfeit of pretty faces and elegant gowns. George Henry, one of the Glasgow group, whose portraits have often had the beauty that comes from a sense of pattern, of arrangement, seems bent now on producing fashion-plates, though his delicate rendering of a vase or an ornament in a background is a reminder that there are things better worth doing, and that he knows how to do them with more distinction. Delicacy of detail and grace of design have always been characteristic of Sir W. Q. Orchardson, and are still; the white gown and cloak in his portrait of Mrs. Moss-Cockle have the harmony of color which belongs to the fashion neither of to-day nor of to-morrow, but to beauty that endures. But the old grasp of character and the old strength of handling have weakened. Here and there, I recall other portraits, less pretentious canvases, where the artist appears to have had time and thought for the placing of his subject and the carrying out of an appropriate color scheme, as, for example, Maurice Grieffenhagen's portrait of his wife, a study in silver and gray, though his pleasure in the harmony evidently distracted him from the equal pleasure he should have had in the modelling of the face and the drawing of the hands.

I find it hard to be more enthusiastic about the landscapes. There are the accustomed Academic machines, large and empty, because, whatever the motive, the size must be made to "tell" in an exhibition; and they monopolize almost all the best places on the line. Landscapes suffer even more than portraits from the painter's determination to make his picture overpower everything near it on the walls of a gallery. But here again there are occasional exceptions, and the quietest effects sometimes are those that tell the most. I remember nothing more vividly than Adrian Stokes's Twilight in the Birches, in which the tenderness of the hour and the grace of the trees are expressed with such sympathy that the tall, feathery birches, as they rise in shadowy lines against the pale gray vagueness of earth and sky, are sufficient subject in themselves, and, as the painter has understood, need no dragging in of anecdote or sham sentiment. If I recall a beach, filled with the movement of many figures, by Walter W. Russell, and the Valley of the Wharfe by Bertram Priestman, I have exhausted the list of landscapes that appealed to me personally or seemed to me concerned with any problem more serious than the painter's desire to be accepted and hung in a conspicuous place.

The sculptor in England has one advantage over the painter: he has more chances of large and important commissions, though he does not fare so well as his fellow-artists in France or America. However, even in England buildings are decorated with sculpture, the public man must have his monument,

the dead their tombs. But the Academy got rid of the one artist to-day who could carry on nobly the great traditions of sculpture inherited from Alfred Stevens. They have allowed Alfred Gilbert to resign, and to live in exile at Bruges. His absence is sadly felt this year in the Sculpture Hall, where there is nothing of special note or distinction. A small marble, Terpsis, by Havard Thomas, some statuettes by M. Frémiet; a bust, Le Sacristan, by Mr. Lantéri, full of character—and that is all.

The Black-and-White Room is not more encouraging. The most distinguished etchers and draughtsmen prefer to show elsewhere, and, except for the prints and drawings of Mr. Short, Mr. Strang, and Mr. Watson, there is little of merit or importance. The Water-Color Room is a wilderness of mediocrity. And the wonder is, after all is said for the exhibition that can be said, how, year after year, at the banquet which princes and ministers of state think it an honor to attend, Academicians can go on congratulating themselves and being congratulated on their success and on the services the Academy renders to art in England. One announcement, however, made last night, and already approved, is of interest. A Royal Commission is appointed for the organization of the British contributions to future international exhibitions. The consideration of a similar organization at home might prove more profitable to the American artist than all his recent attempts to revise the tariff.

N. N.

At the annual meeting of the National Academy of Design, May 12, Frederick Dielman resigned the presidency, which he has held for ten years. John W. Alexander was elected unanimously to fill the vacant place. The other officers were reëlected. Six new academicians were added: Thomas Hastings, architect; Isidor Konti, sculptor; Joseph Pennell, etcher, and Walter Clark, A. T. Van Laer, and Frederick Ballard Williams, painters.

The Tiefurth villa of the Duchess Anna Amalie is to be restored to the condition it was in when it was the meeting place, and often the romping place, of Goethe and the great circle of Weimar.

Frank Dillon, the English landscape painter, has died at the age of eighty-six. He was a member of the Royal Institute of Painters in Water Colors, and exhibited frequently in the Academy and elsewhere.

From Paris comes the report of the death of J. Otis Minott, the well-known painter of miniatures, at the age of forty-six. He was a native of Orange, N. J. He had painted portraits of many notable English people, and at the time of his death was under agreement to make miniatures of King Edward and Queen Alexandra.

The last survivor of the Barbizon school, M. Ceramano, a pupil of Charles Jacque, has passed away. He was born in Belgium eighty years ago, and at the time of his death had been living at Barbizon for more than forty years.

Louis Henry Dupray, the military painter, has died, at the age of sixty-four. He studied under Léon Cogniet and Pils, obtaining medals in 1872 and 1874. He was a member of the Société des Artistes Français.

The death is also announced of Madame Léon Bertaux, the sculptor, in her eighty-fourth year. She was a member of the "grand jury" of the Société des Artistes Français, and one of the founders of the Union des Femmes Peintres et Sculpteurs de Paris.

Finance.

RAISING PRICES BY DESTRUCTION.

It will hardly be denied, even by the people most closely interested in regulating the supply of coffee placed on the world's markets, that the Brazilian project of burning up or sinking in the ocean an inconvenient surplus is a startling innovation. Adam Smith, referring in a classic passage to a similar undertaking by the Dutch in their East Indian spiceries, describes it as a "savage policy." In the present instance, different people will regard the project differently. Bankers connected with the recent "valorization scheme" will possibly approve the plan as a direct short-cut to adjustment of supply and demand. Some who have observed the financial vicissitudes of Brazil and its province of Sao Paulo will doubtless argue that it is better to destroy 10 per cent. of the coffee delivered for export than to impose a 10 per cent. money tax on exporters, with a view to preventing them from exporting. But there will certainly be some voices raised in the comment that to produce an article of usefulness and value, with expenditure of care, labor, and capital, and then deliberately destroy it to keep up the price, is an act of economic folly at which even the Middle Ages would have protested. As the London *Economist* observes of the pending proposition:

> Economically, it is about as sound as the breaking of plate-glass windows in the interests of the glaziers.

And yet this extraordinary plan is a not illogical sequel of an attempt by government to regulate the price of its farmers' products. The simple case of the Brazilian state is this: It found its coffee-planters in distress because of wasteful and uneconomical methods of production, and because the large crops of coffee had forced the price to a level which they considered unremunerative. The government thereupon bought up with its own money a good part of the planters' coffee, storing it away for a future market. At this point, a dim analogy to a piece of economic absurdity in our own history—Secretary Windom's plan of 1890 to help the price of silver by buying it up with the public money and storing it in the Treasury—occurs to mind. We rather wonder that the State of Sao Paulo did not think of copying the Windom scheme and issuing treasury notes for the purchased coffee, making the notes available for bank reserves and redeemable, to paraphrase a certain Treasury document of 1890, "on demand, in such quantities of coffee as will equal in value, at the date of presentation, the number of dollars expressed on the face of the notes at the market price of coffee, or in gold at the option of the government, or in coffee at the option of the holder."

The Brazilians did not do this; they preferred to go into the coffee business outright, with the purpose of "regulating" the price. Sao Paulo invested $88,400,000 of the public funds in buying something more than 8,000,000 bags of coffee. It bought them with the purpose of selling again, and with the somewhat naïve idea that such purchases, from an exceptionally large crop, would put up the price to the figure desired. Any experienced merchant might have predicted what happened, and what will always happen with a huge, unwieldy supply, held on credit and perpetually overhanging the market. Even our silver-purchase scheme, which did not contemplate re-sale of the commodity purchased, forced the regretful comment from President Harrison, within a year, that it had failed "to give the market for silver bullion such support as the law contemplated, and every one knows how the experiment ended."

In the later stages of its preposterous economic exploit, the credit of Sao Paulo became more or less impaired; collateral was asked for such further loans as the "valorization scheme" required. It put up the coffee itself, at a low valuation, for use as such collateral, and taxed the exporters of coffee in a large enough amount to provide for interest and sinking fund. This was well enough for the bankers, but the Brazilian coffee-producers over whom a benevolent government was extending

its protection began to ask where they came in. For them, the new tax burdens were the one tangible result. The time-worn and soothing explanation that the foreigner paid the tax did not somehow seem to be demonstrated by their income accounts. Hence, undoubtedly, the new and recent proposal of the Brazilian state to the bankers' committee, that the government, instead of arbitrarily limiting exports, impose a 10 per cent. ad valorem tax upon exporters, payable, not in money, but in coffee, and that the coffee be destroyed. The pleasing fiction of the taxpaying foreigner is replaced by equally agreeable assurances that, since only the poorer coffee will be thrown away, a gratifying improvement in the average quality of Brazilian coffee exports will ensue. Expedients of this sort never lack arguments based on the general welfare.

The bankers appear to contemplate this plan of a coffee holocaust with equanimity; we are not yet informed how the Brazilian people regard it. We are, however, in no doubt whatever as to how intelligent economists will look upon it. It is no new principle in political economy that the bad results of one step in the direction of unsound finance do not stop with the immediate consequences of that single action; other and more venturesome steps must follow, in order to placate somebody who grumbles because the impossible promises, made in the first instance, have failed of redemption. Where the Brazilian experiment will end, we do not venture to predict.

We think, however, that, quite apart from the fortunes of Brazil, this extraordinary experiment is a sign of the times. It is not the first illustration of a mental perversity, in the matter of prices, production, and consumption, which has largely pervaded the public mind. Not so many years ago, we in the United States had a cotton convention urging the burning of cotton because the American crop of 1904 was so large that makers of clothing would not pay the prices of "boom years" and "Sully corners." All that prevented the trying of the experiment was that each producer secretly hoped that his neighbor's cotton would be selected for destruction, and his own enhanced in value. It was actually urged on Congress, during 1907, that the Government should lend its surplus to cotton growers, on the collateral of cotton, in order to keep their product off the market and advance the price. High authority in the steel-manufacturing community has declared that even in hard times the consumer will not buy any more at low prices than at high prices, and therefore that prices ought to be kept up at all hazards. It is plain that other people than the Brazilians need to be brought back to the inexorable principles of sound economics and finance

THE HAGUE PEACE CONFERENCES OF 1899 AND 1907

By HON. JAMES BROWN SCOTT

Solicitor for the Department of State and Technical Delegate to the Second Conference.

Two volumes. 8vo. Cloth. Price $5.00

Vol. I. The Conferences, 887 pages. Vol. II. Documents, 548 pages.

These two substantial volumes furnish the most complete account of the Conferences which has appeared in English, and will undoubtedly be accepted as the definitive account of the work of those two great gatherings. The fact that the author was the Technical Delegate of the United States to the Second Conference and played a conspicuous part in its deliberations adds to the authoritative value of the treatise.

The Nation.

NEW YORK, THURSDAY, MAY 27, 1909.

The Week.

The spectacle of seventeen Democratic Senators voting against free lumber is one calculated to do an enormous amount of damage to their party. The Democrats in their platform specifically stated that if they should be given charge of the nation's affairs, free lumber would be one of the first results of their administration. When the opportunity came on Monday, Senator Bailey and his sixteen associates voted for a tariff on lumber, just as if there had never been a Denver convention. Moreover, when chided for his action, Mr. Bailey replied that he would not surrender his "conscience and judgment" to the delegates at Denver, a declaration of independence which, if universally followed, would speedily make party platforms as useless as a mastodon on Broadway. Commendable as independence may be in individuals, fixed convictions are indispensable for parties if they would attract the votes of men who believe in the sacredness of pledges. Men who look for sincere and honest observance of campaign promises will be much less interested in the Democracy hereafter. That the Democratic party has protection traitors in its ranks, has been known since the days of the Wilson bill. Monday's vote shows clearly how little encouragement the independent tariff-for-revenue men would have received had Mr. Bryan been elected, and had the tariff bill been in Mr. Bailey's hands for passage in the Senate.

The ever-present and ever-attractive sentimentality of the South found expression at Charlotte last Thursday in Mrs. Stonewall Jackson's greeting of President Taft. Next to Lee, no one is more enshrined in the hearts of Southerners than the sturdy general who paraded the Virginia Military Institute cadets at the hanging of John Brown, and later fought so magnificently from Bull Run until his death on the field of Chancellorsville at the age of forty. That his widow should, just forty-six years later, welcome an Ohio President so gracefully and warmly as the "great harmonizer of all our hearts," is welcome proof of the softening passage of the time. Not more so, however, than the recent presentation to the battleship Mississippi of a silver service marked with the portrait of Jefferson Davis. But few have protested; no one has waved a really "bloody shirt," as would have been the case had there been such an incident twenty years ago. Where else in history is there a duplicate of this spectacle—this honoring of a defeated traitor and a rebel in this semi-official, if not official, way, after so short a lapse of time, and this without any change in the national belief that Jefferson Davis's cause was morally wrong and the occasion of a fearful loss to the nation?

The Georgia Railroad, five hundred miles long, is at a complete standstill; its negro employees have been dragged from their posts, and the property of the company gravely endangered. Why? Because the Order of Locomotive Firemen and Engineers has determined that negro firemen shall be forbidden to occupy positions on passenger-train engines. It is a race issue pure and simple. To its great credit, the railway has manfully stood by its negro employees. It declined to accept the suggestion of the union, because "the adoption of such stipulations would utterly and completely destroy the reasonable rights of seniority in runs which had been acquired by negro firemen by long service, and who had been found worthy of promotion simply as firemen by reason of their efficiency and faithfulness." Unfortunately for the railway company, there is an anti-negro demagogue in the Governor's chair at Atlanta. Hoke Smith, leader in negro disfranchisement, is the last man to meet this situation properly. His political ambitions have not been quenched by his failure to secure re-election, and so he tells the railway that it cannot have the protection of troops because he has not enough militia to patrol 500 miles of road! He offers no train guards, and forgets that if he has not troops enough to permit an unoffending corporation and still more unoffending citizens to continue their lawful business, he has the United States government to fall back upon. The Governor, like the labor unions, probably fails to see that, quite aside from the American tradition of fair play to every man who is doing an honest day's work, he is wrong from a strictly business point of view. Triumph of the union's policy spells economic disaster for a section which continually complains that it cannot get trained workers from the negroes in sufficient numbers for its mines, mills, and shops.

In the long war against anarchy, few blows have told more than will the Supreme Court's decision against two sheriffs and four other citizens of Hamilton County, Tennessee. At last every little semi-barbarous community, North and South, has received notice, from an authority it cannot ignore, that the price of defying law is heavy and will surely be collected. The notice has been served late, but it was bound to come. Lynching, and all that goes with it, began as an impulse. Men were resentful toward sluggish courts and the legal sophistries that allowed criminals to escape justice. But, long ago, the impulse became a habit, and then the point of view changed. There was no pretence of helping the law along; lynching became merely the hot will of the mob. The Chattanooga outrage in 1905 typified this new sentiment. Because some townsmen thought a negro ought not to be allowed an appeal from local courts, the sheriffs invited a riot and surrendered their prisoner without even feigning resistance. In punishing them for contempt, the Supreme Court opens the way to thoroughgoing reform.

The prospect that, within a fortnight, the Supreme Court justices of New York may be conferring to rationalize their procedure, almost makes one think human nature is changing. Lawyers hate change. A few far-sighted jurists, like President Taft and Gov. Hughes and Judge Brewer, preach reforms which will give the poor litigant a fair chance. But that the ninety-seven leaders of the New York bench should even invite one another to contemplate such a move, defies history. One would like to read in their project the death-sentence of the legal formalist, whom men long ago found guilty. But between sen-

tence and execution, many a day will slip by. Some causes of delay and crowded calendars ought to be removed with no difficulty. The double appeal, for instance, is a defenceless imbecility; reversal on immaterial technicalities cannot survive criticism. Other reforms are debatable. When the justices come to instruct the Legislature, however, in the art of drafting statutes which a court can interpret at first reading, thorns will spring up. The amateur statesman deems it his inviolable right to jot down a pet measure as the spirit moves. And we fear he will not yield, even if assured that his cumbrous and confused laws delay and confound the administration of justice even more than do the antiquated court rulings.

This year's Peace Conference at Mohonk took a higher tone than the last one on the folly and peril of great armaments. The swift development of the big-navy mania, with its inevitable accompaniments of suspicion, jealousy, and hate, during the past twelvemonth, fairly compelled this attitude. Never did the argument that great navies are the surest guarantee of peace appear more hollow than in this present year of grace and madness. If something is not done to forestall this wicked craze, an explosion will follow that will shake the world. The Mohonk Conference appealed to President Taft to take the initiative in calling an international congress to work for general disarmament. Our neutral position certainly would enable us to make such advances without exposing ourselves to the charge of selfish motives. Mr. Taft must personally sympathize with the objects aimed at by the Mohonk delegates, though it will take time, and be a matter of delicacy, to make the necessary diplomatic approaches. But the need of applying reason to a wholly irrational state of affairs is urgent. A move for disarmament now would be on a par with President Roosevelt's intervention in order to bring about peace between Japan and Russia, and would be as heartily applauded by civilized nations. We greatly hope, therefore, that President Taft may soon undertake negotiations. One English speaker at Mohonk expressed the desire that the United States government might give Germany a good scolding! That is a fine illustration of the precise disease to be cured—a blind antagonism and unwillingness to see that anybody is at fault except foreigners.

Incredible though it may seem that wages in any occupation have dwindled during the past twenty years, while the cost of living has been rising, Prof. Guido H. Marx demonstrates that this has actually happened in the case of college instructors. His article in *Science* on "Some Trends in Higher Education," based on information from Harvard, Cornell, Wisconsin, California, and Leland Stanford, makes clear that the college professor is much less to be pitied than his colleague of lower rank. Poorly remunerated as the professor still is, his salary has been slowly approaching its proper size; but the instructor's has dropped so far that, "in purchasing power, the average teacher of 1908 is but 60 to 70 per cent. as well off as was his colleague of twenty years ago." At Johns Hopkins the average instructor now receives $725 a year, at Brown $734; at most other good colleges nearly $1,000, and sometimes a little more. Now, the significant fact in all this wretchedness is that the average instructor is to-day the average college teacher. Professor Marx points out that, twenty-five years ago, there was a full professor for every fifteen or twenty students, while now there is only one to every forty to eighty. Instructors and assistants, however, now comprise one-half, or even two-thirds, of many a university's teaching staff.

It is easy to explain how the instructor has been brought to this pass. Our colleges have been growing faster than their purses; house must be joined to house and athletic field to athletic field, that the enrolment may measure up as long as any rival's; so, of course, the budget committee's pruning knife has to trim the greenest shoots. But what is the price of such economy? Let each recent alumnus, Professor Marx suggests, asks himself how many of his courses brought him into live contact with the distinguished men of his college. Rather, we should say, let him ask how many of his young instructors had lapsed into a stupefying routine under the pressure of outside odd jobs undertaken to make ends meet. Or let him ask how many of them failed to inspire because they were easy-going young bachelors, with no ideals above a dormitory room, $15 a week, and a long summer loafing. To be well educated, one need not sit at the feet of a Remsen, a Norton, or a James; but a teacher is indispensable who can give his best, and whose enthusiasm has not been killed. A full supply of such men our colleges are not furnishing. Nor will they, so long as scholars have to work, until well past thirty, for the wages of a New York street-sweeper.

Hopes of many American golfers were dashed last Monday by the putting out of Jerome Travers in the first round of the British amateur championship. The belief had been held, and with good reason, that he was able, if he would only take care of himself, to hold his own with the best English players. However, golf is perhaps supreme among all games in yielding a full supply of adversity's sweet milk, philosophy. It is good to win, but if you are beaten you can at least have the satisfaction of moralizing about defeat. Nowhere else is the element of truth more apparent in the cynical French saying about the comfort to be got from the misfortunes of one's friends. If even a master of golf, like Travers, can flub three or four tee-shots out of eighteen, find himself bunkered and trapped without excuse, and miss a critical put of three feet—why, it shows that there is not such a tremendous difference between the best of us and the worst. Chronic duffers will now say that Travers knows how it is himself. And the severe moralists of the game will find their highest claims sustained. How can you deny after this, they will ask, that golf summons into exercise a man's finest powers and virtues? Let there be but a momentary lapse, nervousness at the first two holes, a wavering eye at the tenth, slackening watchfulness or determination at the thirteenth, and you see how fated is disaster. If Travers had won, there would have been much glorying, with praise of the perfection of his style, and many exhortations to go and do likewise; but we are not sure that the sterner practitioners of the game will not find in his speedy defeat material for still more fruitful reproof, correction, and instruction in golf righteousness.

Earl Grey has broken a precedent by

choosing to fill out his six years as Governor-General of Canada, instead of resigning at the end of the fifth year. This is a frank and manly way of saying that Earl Grey likes Canada. It carries the implication that the Canadians are fond of their Governor-General. On this point there is abundant testimony. Not even the popularity of Lord Dufferin was so great as the strong personal liking for Lord Grey throughout the Dominion. The constitutional limitations surrounding the chief executive in the English scheme of government are naturally reinforced in Canada by the fact that their Governor-General is a stranger imposed on them from without. There was once an inclination among Canadians to look upon their chief executive not only as a figurehead, but as one from whom great interest in the people that he nominally governed was neither necessary nor desirable. Lord Grey has refused to be the formal figure of a viceroy. He has travelled about much, mingled with all kinds of people, and evidenced as deep an interest in the future of the Canadian West as the native-born.

Concerning the panic about invasion that is now afflicting England, we get little here but the shrieks and alarums of the Opposition, because that makes good news. We scarcely hear of the dogged way in which men like Winston Churchill and War Secretary Haldane are standing up to the hard task of instilling common sense into the fevered minds of their countrymen. For instance, in all this clamor about German invasion, the war maniacs have been taking it for granted that the British army is an utterly negligible factor. Only a year or two ago the British alarmists used to fall into a cold chill over a German raiding party of 5,000 men that might land at any time anywhere and do anything they pleased. But after a while even the humorless Jingo mind awoke to the fact that 5,000 foemen were a pretty small scarecrow to frighten a puissant nation of some forty millions. So the raiding party of 5,000 men jumped all at once to an entire German expeditionary corps. Now what are you going to say? Suppose the British fleet is enticed away or held in check while 30,000 Germans land in Yorkshire. What will you do then without an army or with this army of yours which even Lord Roberts pronounces a sham? Answers Mr. Haldane: We have an army, and it is not a sham. He stated the other day that England has her expeditionary force—her standing army—which consists now of 167,000 men, "trained to a much higher standard than Continental armies." Behind them is a reserve of 150,000 men, of men who have served their term in the regular army. Behind them are fourteen divisions and fourteen brigades of Territorials; Mr. Haldane admitted that it was not known how much these were worth at the beginning of a war, "but they were worth something." In other words, some 320,000 English regular troops, backed by a militia of probably half a million, ought to cope with the German expeditionary corps that is going to land in Yorkshire. "I am not much concerned," said Mr. Haldane, "about the bolt from the blue." But since when have facts appealed to the Jingo? If he wishes to see German airships hovering over the mountain top once crowned by Arthur's Camelot, why, dash it, sir, he will see 'em.

The failure of the French general strike was inevitable. Without serious preparation, a handful of irresponsible leaders attempted to bring about a conflict which only the most bitter necessity could excuse, and only the most resolute attitude on the part of the entire working population of a country could render successful. In Russia, four years ago, it was the whole nation that struck—railway employees, telegraphers, clerks, physicians, lawyers, and judges. In Austria, universal suffrage was granted because there, too, it was evident that the mass of the nation was aroused. In France, the occasion was inopportune and the cause was frivolous. It all grew out of the postal strike of a few months ago. That strike was settled when the employees received what they assert were assurances that the head of the postal department, the obnoxious M. Simyan, should be got rid of. The government denies that it made such promises. In so many words, of course, no government would make such a promise. Yet there can be little doubt that, if the postal employees had given M. Clemenceau time, M. Simyan would have gone. Had he been sacrificed immediately, there would have been clamor in the Chamber that the Ministry had surrendered to the unions. The good will of those unions M. Clemenceau does not despise, but the safety of his Ministry came first. When, therefore, the labor leaders began praising him for the dismissal of Simyan, it was evident that they were looking for trouble. The outcome shows that they found it.

As a result of the conference between Von Bülow and the Kaiser, it is announced that there will be no resignation, and that there is the fullest accord between them on all matters relating to domestic or foreign policy. The Kaiser, as a special mark of favor, has asked Von Bülow to accompany him to the Sängerfest at Frankfort-on-the-Main. Beyond doubt, this public support will strengthen the Chancellor's hands; but it in no wise solves the difficult Parliamentary problem before him. The latest to voice the demand for a solution of the fiscal dilemma is the Bavarian heir-apparent, Prince Ludwig, who has just come out strongly for the proposed inheritance tax, and urged the Reichstag, in the name of patriotism, to terminate the existing deadlock. But this appeal to the Conservatives is like asking our Congressmen and Senators to vote on the tariff bill without regard to local interests and special privileges. There is at present little prospect that when the Reichstag meets again, after its brief adjournment, the *bloc* will be in any softer mood or more united than it is to-day. But the chances seem to be that some compromise will in the end be reached—in no sense a genuine reform of the whole fiscal system, but merely a makeshift.

South African union now seems assured in the near future. After the proposed Constitution had been discussed by the separate colonies, with some amendments strongly urged, it was referred back to the Convention at Bloemfontein. There it was changed in some particulars—the plan of proportional representation, for example, being dropped—and was then signed by all the delegates of all the colonies. Speedy ratification is now looked for. The English Lord High Commissioner, Lord Selborne, made a speech at the public banquet given after the Constitutional Convention adjourned, in which

he said that the whole affair was in the hands of the South Africans themselves. The political bread which they might choose to eat would be home-made. Lord Selborne predicted that when the matter came before the Imperial Parliament, the only competition between English parties would be to see which could interfere least with the work of the Convention. We may, therefore, count speedily upon having to learn to shape our tongues to the new political designation, Commonwealth of South Africa.

A SHORT WAY WITH CONSUMERS.

When Mr. Pickwick was sued by Mrs. Bardell for breach of promise of marriage, it occurred to the elder Mr. Weller that the defence ought to concentrate its efforts on establishing an alibi. Very much akin to Mr. Weller's scheme is the argument lately hit upon by good friends of the tariff. Is it in behalf of the consumer that the demand for a downward revision of the schedules has been advanced? Then deny that he exists. There is no such person known to man. We are all a lot of happy, happy producers; and for everything that is taken away from us by the Dingley law, we get back something else, and, precisely as if we were in Ireland, a little more besides. The New York *Sun* makes merry over the myth of the consumer, the rhetorical figure, this pure abstraction that has its origin in the brain of the Cumminses and the Dollivers, the Borahs and the Baileys and Beveridges.

The Chicago *Inter Ocean* follows suit, but takes the trouble to reason with the deluded ones. Do the farmer and the mill-hand consume without producing? Does the clerk? Do the lawyer, the minister, the journalist, the actor, the college professor? Which of these fails to profit by prosperity? Which of these, therefore, is the "simon-pure consumer" you are looking for? And the *Sun* and *Inter Ocean* leave us confounded, too dazed to make the point that it is not we, but they, that have dragged out this unhappy abstraction of a "simon-pure consumer" whom they have so pitilessly gored. "You protest against the extermination of the cherry-colored South American elephant with a duck-bill and a taste for French water-colors? *There is no such elephant!*"

It needs no ideal consumer to hammer home the iniquities of tariff plunder. Outside of Tahiti and our own most exclusive circles, we are all producers and consumers in part. But it is one thing to show that the average American citizen takes as well as gives; it is another thing to say, The taking and the giving balance perfectly. Q. E. D. In that maladjustment between income by the grace of Dingley and outgo by the grace of Dingley, lies the crux of the problem. Granted that John Smith produces as well as consumes. But what the tariff does to him in his capacity as consumer is very well known. What it does for him in his rôle of producer is by no means so clearly evident. The tailor, the grocer, and the candlestick-maker speak more definitely to the point than the compiler of Republican statistics on the increase of the country's savings deposits. Is it the advocate of the rights of the consumer that deals in theory and abstraction, or is it the *Inter Ocean*, when, finding it "obvious" that Protection showers blessings on the "clanging mills, the peaceful farms, and the busy marts of trade," it bends down one cheerful finger after the other:

> If the mills have less work the lawyer for the mills has fewer cases. If employment is less varied and plentiful there are fewer people with means to pay the preacher. Missionary contributions decline in hard times. And men who look at newspapers chiefly in search of jobs are not the "regular subscribers" who give the journalist peace of mind. Neither do they come numerously to weep or laugh with the actor.

Has a fuller circle of human felicity ever been traced?

But if the lawyer on his average munificent income of five or six hundred dollars a year, the college professor who is a little better off, the doctor who is a good deal worse off, the preacher, the missionary, the country teacher, were to protest that somehow or other the whole happy scheme of protection does not quite fall into such perfect adjustment, he will be told that his troubles are only temporary. "Ultimately" is here the great answer and panacea. For a man who has had so much fun with the ultimate consumer, your tariff man is very fond of the "ultimate" adjustment of earnings and cost under Protection. The price of the mill worker's coat goes up the moment a tax is clapped on clothing, but his wages rise ultimately. The college teacher finds the cost of children's shoes and hats, of eggs and butter and beef, grow from month to month almost; his salary follows ultimately—say about the time necessary for the money he has contributed to the Oil Trust to get back to him in the form of an endowment. The bookkeeper, the clerk, the country editor, feel the pinch in the present, but look for solace in the ultimate. The city school teacher sees everything go up but her salary—rents, clothes, food, recreation. Her salary will go up, ultimately; as soon, we suppose, as the boys and girls she turns out have become prosperous wage-earners, and by enriching the nation as well as themselves will make it possible for the city to increase its teachers' pay. Problem: Find the age of our school-teacher when she gets her increase—ultimately.

There is no such thing as a consumer. The Western Senators who are clamoring for a reduction of duties do so against the desires of their constituents, as politicians always do. There is no such thing as a consumer, but the Republican national platform held out the promise of revision because the issue was unpopular with the country, as political platforms always do. There are no consumers, but Mr. Taft found it necessary to pledge himself and his party to a cutting down of tariff schedules. He did it because he wanted to lose votes after the fashion of all candidates. Strange, is it not, that a powerful political party should have let itself be frightened by so obvious a myth as the consumer? Now, the unscrupulous jobber who is actually responsible for high prices, he is a real person. The retail dealer who robs the public in turn, he is a real person. The Protection Senator who would never dream of letting manufacturers draw up his schedules for him, he is a real person. But the consumer? A wraith, sir; a pure abstraction! How absurd to imagine that we are anything else but a people who prosper, like the inhabitants of the Scilly Islands, by taking in each other's washing!

UNKNOWN DIPLOMATS.

The recent death of Friedrich von Holstein, long in the service of the German Foreign Office, was barely mentioned in the cable dispatches to this country; but in Germany, as well as in France and England, the significance of

his career was understood. He was one of the men who greatly serve the state without public recognition. The *Frankfurter Zeitung* goes so far as to say that Herr von Holstein, after Bismarck's retirement, was really "the director [*Leiter*] of our foreign policy." Yet he was not even an under-secretary! His place was, by preference, in the background. Personally, he was the most retiring and publicity-hating of mortals. In an age when everybody is photographed in every possible relation of life, not a single portrait of Von Holstein exists. In a land of uniforms, he did not even own a dress-suit! Such at least is the inference from the story that, when the present Emperor expressed a desire to meet the extraordinary man who knew and did so much but was so rarely seen, Von Holstein replied to Prince Bülow, who invited him to dinner to meet the Kaiser: "But I don't believe that I have a dress coat. I will try, however, to get one made in time, and, if I can't, perhaps the Emperor will take me as I am."

This Privy Councillor of the Foreign Office worked in silence and privacy, but he worked with iron industry, and made himself an almost indispensable master of the entire foreign relations of Germany. Prince Hohenlohe once described him as "the diplomatic chart of the German Foreign Office." Trained under Bismarck, he served that statesman in the Arnim affair, and enjoyed his confidence and respect—until he refused to retire along with his chief. After that, the customary venom from Friedrichsruh was shot at him. But the quiet man stuck to his post, added steadily to his vast knowledge, and under successive Chancellors and Foreign Secretaries got the threads of German foreign policy more and more firmly into his own hand. Those who ought to know assert that he was more responsible than any other man for the German seizure of Kiao-chau in China. Von Holstein's real authorship of the policy pursued by Germany in Morocco was so practically avowed that, when it failed, at Algeciras, his official retirement soon followed, just as if he had been a responsible Minister. His great attainments were never questioned, though his judgment might be impugned and his methods criticised. He seems to have been a lover of indirection. One of his colleagues once said of him: "If he wanted to get to Madrid from Berlin, he would go round by Jerusalem." This quality in the man gave point to the objection made against him that he was too clever by half—*überklug*. It is a grave fault in any public man, gravest of all in a diplomat.

The main suggestion of such a life as Von Holstein's is the enormous importance of the permanent officials of any government. They seldom get much of the glory, but they often have the satisfaction of doing most of the work. Their superiors come and go, but there they are, year after year, with their hand on the very pulse of the machine. In all departments, such men are to be found, who simply must be retained, even under the spoils system, because without them the public business cannot be done. And as the foreign policy of any country is, or ought to be, the most continuous of all governmental policies, it comes about that these inner-office diplomats, the men who are seldom seen and never heard, inevitably acquire great power. Lord Salisbury used to say that the policy of England in India was really dictated, not by the Secretary for India, or by the Viceroy, but by the permanent officials of the India Office. A. L. Lowell's volumes on the "Government of England" bring out strikingly the way in which the old employees of the Colonial Office, or the Foreign Office, come to look with contempt or apprehension or complacency, as the case may be, upon their temporary chiefs. One secretary coolly wrote of his superior that he was "not more in pupilage than is necessary and natural." It was once declared in Australia that "the million and a half of Englishmen who inhabit these colonies . . . have been really governed by a person named Rogers." This Rogers was a permanent under-secretary. He calmly wrote of even so competent a Chief Secretary as Lord Granville: "He is very pleasant and friendly, and I think will not meddle!"

In our own Department of State, we could not point to any official who has held a position precisely like that of Von Holstein. We have, to be sure, our repositories of precedent and authorities on ceremony, like Mr. Adee, but it may be doubted if any one of them ever aspired, or was able, to play such a part in directing foreign policy as did the late *Geheimrat* of the German Foreign Office. The difference lies partly in our traditions, but more in our circumstances. The isolation of the United States, with the comparative simplicity of our foreign relations, has not made it necessary for our State Department to command the services of a man like Von Holstein.

He died at seventy-two, after a diplomatic service of forty-five years. Of the patriotism of such unrecognized servants of the state, there need be no question, but one wonders if they do not sometimes have, as they review their work, what Busch called in Bismarck "an affection of the nerves." Under one such onset the Iron Chancellor said:

> There is no doubt whatever that I have caused unhappiness to great numbers. But for me three great wars would not have taken place, eighty thousand men would not have been killed, and would not now be mourned by parents, brothers, sisters, and widows.

Such flashes of insight, or twinges of remorse, must now and then come even to the diplomats behind the diplomats.

CHEERFUL DESTROYERS.

It is curious to observe how the "wild-eyed" socialist agitator has vanished from the newspapers. His place has been taken by the "parlor" socialist who comes of American ancestry, shaves every day, and expresses his views in well-modulated tones and with due regard for the feelings of his audience. When he embraces Socialism, he does not necessarily hurl his gauntlet into the face of society. Ask him, and he will tell you that his quarrel is not with society at all, but with those who keep the social system from being as comfortable as it might be made. That the world can show many pleasant things even now, he won't deny; differing sharply in this respect from his predecessors of a few years ago, to whom even the prospect of nature was spoiled by the utter vileness of man. Today, some socialists find Palm Beach in February just the quiet sort of place for writing editorials on tuberculosis in the tenements. They will tell you frankly that they like Palm Beach, and that if only the entire American "proletariat" could come to Florida with them, their cup of happiness would be quite full. Their cup of happiness, as a rule, is of fine Dresden.

If one should charge the leaders of

Socialism with insincerity, it would be falling into the bad manners which socialists themselves are fast discarding. The most intelligent socialists, for instance, do not attack Mr. Rockefeller or Mr. Carnegie in person. The proper course now is not to hate them, but to be sorry for them. Mr. Rockefeller is as much the victim of the present insane social system as the unemployed workman at his gates. Present-day socialists accept things as they are to the extent that they can see how essentially weak is man and how powerful are the circumstances that shape him. They can understand why Mr. Rockefeller should like his ease. They can see why he should believe what he believes in. They have come to recognize that men are men first and capitalists, or socialists, afterwards. Hence a decided cheerfulness of tone about latter-day Socialism, with comprehension of the fact that, even in this poor world as it is, socialists have a good deal to enjoy and even something to learn.

We do not know how socialists amused themselves in earlier days, but the chances are that play was looked upon as somewhat inconsistent with true Marxian zeal. To-day the *International Socialist Review* of Chicago advertises an artistic pack of socialist playing cards on which John D. Rockefeller is the king of spades. He holds a sword labelled Profit and Interest in one hand and a University in the other. Across his breast runs the spirited verse:

> I love to oil the college wheels
> And grease the pulpit stairs
> Where workmen learn to scorn the strike
> And trust to Heaven and prayers.

The publishers are quite right in describing these cards as "just the thing to break new ground for socialistic propaganda." Shall there be no cakes and ale because Karl Marx once lived, no pinochle and skat and poker? "Get a workingman to read what is on these cards," say the publishers, "and he will be mighty likely to show some signs of intelligent discontent by the time he lays them down." Particularly if the other man holds all the socialist aces.

Whether there are socialist playing blocks on the market, we do not know. But there is no reason why socialist children should not build little labor exchanges and coöperative commonwealths on the floor, and improve their spelling at the same time. There is no telling how far back one could go. Socialist infants might cut their first teeth on a rubber link from the chains that bind the workingmen, and nursery bottles might have blown into the glass, "This is the way capitalism drains the laborer." Going from fancy to fact, we might point out that so austerely spiritual a socialist as John Spargo has condescended to write a story-book for children, which is entertaining as well as instructive. There is a chapter on Robert Owen, and there is another chapter headed "A Little Talk on Karl Marx." The socialist Sunday-schools are firmly established in New York, and their children's fête at Cooper Union recently was a high-spirited entertainment. It must be these Sunday-schools which make use of the "Socialist Primer," that has greatly stirred up the editor of *The Square Deal*.

Yet one only has to read the citations from the "Socialist Primer," printed in *The Square Deal*, to see how vain is the fear of its editor. Lesson V has a picture of a heavy representative of the predatory classes spurning a beggar. The text is:

> Here is a man who begs. Why does he not go to work? He would, but he cannot get a job. Can he not go to work in a shop? No, for a fat man owns the shop. Can he go to work in a mine? No, for a fat man owns the mine. Can he go to work on the land? No, for a fat man owns the land. It is a great scheme! When the thin man can get work, he must work for the fat man. The thin man is poor. Is the fat man poor? The thin man makes the fat man rich. Would you like to be the thin man?
>
> Who works for the fat man?
> Who is a slave?

Now, we submit that this is miles away from the pike-staff and the bomb. Are society and the family really in danger of violent disruption at the hands of people whose sense of humor overflows even into their schoolrooms, who buy their children picture books, teach them socialist songs and dances, and are themselves fond of a quiet game of cards?

THE "QUARTERLY" CENTENARY.

Periodicals have their *fata*, as well as books, and time has brought about the hundredth year of the continuous existence of the *Quarterly Review*. Founded in 1809, as a Tory counterblast to the Whig *Edinburgh*, its influence for many years upon English politics and literature was undeniably great. With famous editors and still more famous contributors, it made or marred the fortunes of many a public man and many a writer. If it has recently sunk from its high estate, this is doubtless due more to the changed habits of reading, and the consequent new conditions of successful publishing, than to any disastrous falling off in ability. It is not a little pathetic to see the *Quarterly* in these latter days endeavoring to assume its old rôle of arbiter of the fate of nations—as in its violent attacks upon Germany. To use an expression of one of its own founders, George Canning, this irresistibly gives the impression of "the contortions of the Sibyl without its inspiration."

As the ups and downs of political parties are, after all, of less significance, or, at all events, of less perennial interest, than the general intellectual movement expressed in letters and science, it is the historic place long held by the *Quarterly* in literary criticism which most prompts to comment. It early raised many questions of editorial and publishing ethics, or, at least, etiquette. The first editor, Gifford, was a valiant knight of the blue pencil. Inviting the ablest pens to contribute, he wreaked himself upon their manuscripts in a way to evoke groans from the authors. Southey, in particular, was subject to ruthless evisceration by Gifford. It may have been the poet laureate's unhappy experience that Byron had in mind, when he wrote, in "Don Juan," about his intention to

> —defy
> All other magazines of art or science,
> Daily, or monthly, or three monthly,

for the reason that

> —the Edinburgh Review and Quarterly
> Treat a dissenting author very martyrly.

But this custom had its reverse. Some writers were permitted in the *Quarterly* to review their own books! Walter Scott was the best-known favorite, in this way, though his chief motive was to keep up the mystification about his authorship. Yet in his article about himself there were some passages of extreme laudation. This seems very strange, coming from the man whose "Journal" showed that he took the most hard-headed view of his own productions, receiving extravagant praise with ill grace and private grunts of "Nonsense!" But it is now explained that these highly flattering sentences were inserted in Scott's review by the editor, Gifford. This revelation relieves

Sir Walter, but the indelicacy of allowing a writer to be his own anonymous critic remains without justification. It is said to have been "a not uncommon practice of Gifford's day."

The most famous, or notorious, contributor to the *Quarterly* was unquestionably John Wilson Croker. For years his secret pen was a terror to Englishmen in all walks of life. Statesmen, great figures in society, poets in particular, suffered from his ambushed attacks. It is probably not true that his stupid and brutal review of "Endymion"—"so savage and Tartarly"—had much if anything to do with hastening the death of Keats; but it was a thoroughly wrong-headed performance, as was also the same critic's sarcastic reception of Tennyson's first poems. The feud which raged between Croker and Macaulay—who deliberately set out to "dust that varlet's jacket"—may very well have served to fix the popular estimate of the former's attainments too low. Yet that there was a certain tang of malice in much that he wrote, seems indisputable. It is implied in the "one good thing" of Sir Robert Peel which is recorded in the biography of Kinglake. Standing before the portrait of Croker in the Academy, "Wonderful likeness!" said some one; "it gives the very quiver of the mouth." "Yes," said Peel, "and the arrow coming out of it."

If changed mental habits and altered methods of publishing have made all quarterly magazines appear more or less like survivals, even in Great Britain, the reason for their decay or disappearance in the United States is still more obvious. Years ago, Lowell wrote, apropos of our then most famous quarterly, the *North American*, that it was destined to become extinct in that form—it would, he said, like a megatherium, crawl off into a swamp to become a mere fossil. Such was the inevitable tendency of the time. It persists to-day. Serious reading of deliberate writing is at a discount. Even the monthlies find it difficult to maintain a high standard, intellectually. As for the great mass of readers of print, to which our system of free education has given birth, what they desire is, not a magazine that appears once in three months, but a newspaper that is issued once in three minutes. In place of matured judgment, what is in favor is "brawling ignorance all day long."

ATHLETICS ON THE DEFENSIVE.

Columbia University, in the course of the next few days, will more than wipe out the blot on her 'scutcheon which the elimination of football left there. South Field, the university's playground, will have passed through the first stage of a process of reconstruction which aims to make it one of the most elaborate athletic grounds in the country. Probably no other university can vie with Columbia's new field in convenience of location. Franklin Field at Philadelphia is not very far from the campus, but South Field is nearer still, lying literally at the very doors of the college hall and dormitories. New York University has its football field and running track on the campus, but New York University is not situated in the heart of the city, and we take it that the facility with which thousands may come and cheer will continue to be an important consideration with athletes. When all the work is done, South Field will have a football field inside a four-lap track, tennis courts, and a grandstand of which the exact dimensions have not yet been determined. The class of '99, which celebrates its decennial next month, commenced the rebuilding of South Field in conjunction with the class of '84. The classes of 1900 and '85 will make a beginning on the grandstand. In the swift procession of decennials and quarter-centenaries South Field will not have to wait long for its complete equipment.

In its splendid gymnasium, its new track and field, and its boathouse but a few minutes away from its doors, Columbia owns a magnificent athletic plant. The interesting question is whether this elaborate and costly apparatus is to be used for the good of the university community at large, or whether, after a few years of obscuration, the star athlete is once more to seize the centre of the stage at South Field, while the anæmic mass of undergraduates cheer from the grandstand. If Columbia persists in her present policy of giving the ordinary man a chance at play as well as at study, she faces unlimited possibilities of good. For the freshman and the sophomore, a minimum of work on the gymnasium floor is already compulsory. If the requirement should be extended to the upper classes, and if the scope of the work were widened so as to bring every undergraduate out into the open air, and, possibly, on the water, the principal evil of our present ferocious athleticism would be in a fair way to disappear. For the chief trouble with the cult of the body in our colleges is not so much that a few undergraduates make a religion of athletics, as that the great mass of students do not make it a daily, sensible pursuit. In a way, the two evils are connected. Where every undergraduate played at some game or other, the exceptional athlete would still get his just meed of admiration. But there would be absent the senseless hurrahing and celebrating.

The cause of the average student against the star athlete gains in strength as physical directors, coaches, and trainers continue to tell tales out of school. Athleticism as a fine art, or the only art in life, is somewhat on the defensive. It is not only that athletics have been accused of not doing enough for the average undergraduate, but that the star athlete himself does not seem to be deriving quite all the wonderful advantages he was supposed to obtain from an exclusive devotion to play. The general public has the notion, for instance, that athletics do not conduce to longevity. Coaches and directors have been called upon rather frequently of late to explain that the death of former college stars was not due to over-exertion. Whatever the merits of this particular question may be, people have usually passed it over, in view of the many cardinal virtues that football or rowing was supposed to inculcate. Courage, resourcefulness, self-restraint, fortitude under defeat, sacrifice of self for the common welfare—these are but a few of the moral benefits of an undergraduate course in football. Comes now Dr. Nichols, late of Harvard, and on many essential points begs leave to differ. Sports do not develop physical courage, which, after all, is "one of the commonest traits in the world." The factor of endurance is much exaggerated; there really isn't much pain and exertion involved. Fair play, he says, is not always present in an athletic competition. Of the theory that athletics keep young men out of bad habits, he thinks little. Yes, there are good features. The athlete is trained in obedience, in "coördination, and cooperation, in self-restraint now and then."

Now, once upon a time, it used to be

supposed that books, too, exercised some sort of moral influence. Courses of study used even to be called "disciplines." The much-belauded virtues of the athlete have somewhat obscured the fact that perhaps there is as much self-denial in saving on one's meals to pay the college fees, as in subjecting one's self to the rigors of the training-table. Perhaps there is as much tenacity in sitting up over one's books with a headache as in plunging down the field with your cheek laid open. Perhaps there is as much self-restraint involved in giving up a pleasant engagement, in order to cram for an examination, as there is in refraining from slugging the man with the ball. Athletics are a moral agent in so far as they provide an outlet for superfluous energy and satisfy nature's demand for play. But it is hard to see what moral value inheres in a crazy system of athletics which promotes muscle-worship among 5 per cent. of our students, and leaves the men of studious tastes and of average or poor physique ashamed to do what they ought to do for themselves and what they would like to do, on the gymnasium floor and in the open air.

ART AND ACTUALITY.

That Anatole France's "L'Ile des Pingouins" is one of the wisest and wittiest books of our day most of its readers agree. Many, however, would regard as almost unreadable the considerable portion that deals with recent French politics. So sharp a contrast in mood and quality deserves a moment's attention. In the early chapters of the Penguins—an allegory of the origins of civilization—Anatole France asserts himself as a true successor of Cyrano de Bergerac and Dean Swift, and yet has never been more engagingly himself. Since Rabelais, universal satire has not invested itself with equal geniality, yet the smiler, as a true satirist should, wears a knife under his cloak. Not less imaginative than these legends of the bad childhood of the race is the final sombre vision of a great modern city literally bursting from the pressure of the social hatreds it has engendered. It would be hard to say whether our author is more admirable in imaginative retrospect or in prophecy; it is certain enough that he is not admirable at all when he shadows forth his own times. In the middle of this book, the adage to the contrary, you cannot go safely.

Why are the Boulanger affair and Dreyfus, why are the vicissitudes of the Waldeck-Rousseau Ministry, worse subjects for imaginative prose than the acclamation of the first king or the ultimate triumph of anarchy? Because, we think, there is both too much and too little in these modern subjects. Too many facts, too little meaning. It is to the tyranny of the fact that M. France has succumbed most lamentably. Long stretches of his book sink to the level of the *roman à clef*. Why? Because, we think, he is obsessed by the unescapable actuality of MM. Reinach and Labori, Millerand and Delcassé. Of all the moderns, only Boulanger (Chatillon) and Gen. Mercier (Greatauk) appear either impressive or real. And here there seem to be special reasons that favored detachment and perspective. Boulanger was more of a superstition, a casual portent, than an effective personality. He was, in short, that rare occurrence: a ready-made hero of legend. As for Mercier, utter scorn of him seems to have given to our author that calm out of which must grow the finer generalizations of the imagination. What is superlative is already legendary, and Mercier was nothing if not superlative.

That the other moderns should cut but a pale figure was inevitable. Anatole France has lived too deeply in their experiences. In his desire to condemn, to vindicate, or simply to do justice—all motives of a perturbing sort—he misses the serenity of the creative spirit. In his solicitude to represent, he almost forgets to invent. The result is a streak of dull allegory in a fabric elsewhere highly symbolical and imaginative. How far this partial failure was in the nature of the case, how far due to individual causes, we shall not attempt to decide. Evidently, the personal factor has counted for something. To one occupied with the infancy and decrepitude of an entire civilization, the Dreyfus case need not have loomed so large, nor yet the aberrations of the present Parliamentary régime in France. Here the individual scale seems at fault, if for natural and even laudable reasons. Taking the incident more broadly, it may afford an argument to those who believe in the complete disinterestedness of art. At least the moral holds that when you would soar in the interstellar spaces of legend you must not draw up in your vortex too much dust from the boulevards or the Bowery.

Yet the daily spectacle becomes refractory stuff for the artist the moment he works in the spirit of an interpreter. He may record it, travesty it, gossip about it with impunity. Any attitude toward it, save the judicial, seems acceptable to the muses. Nevertheless, the temptation to judge one's own times will probably remain irresistible. The artist who fails before this proof may draw comfort from the thought that for being less of an artist he has been more of a man. With the paradox that art must not too overtly serve its own day and generation we cannot deal now. Has it not troubled the moralists from Plato to Tolstoy—and Anatole France?

RECENT GERMAN POETRY.

Comparison of some volumes of verse recently published in Germany with those that were coming out about ten years ago has a twofold interest. It proves that the mind of the modern German, then soaring in the heights of the Overman and circling about the ego, has gradually returned to earth, and that contempt for the conventional vehicles of poetical expression is no longer considered a necessary adjunct of individual power. The prophetic grandiloquence of Zarathustra-Nietzsche, then at its height, has since subsided. The cheering yawp and the swinging stride of Whitman's Muse find no longer so direct and noisy an echo, but there are evidences that some of his wholesome spirit has been assimilated. Eroticism, too, then a theme frankly presented in manifold variations, enters but feebly into the verse of to-day. All these facts are significant.

Though incomplete, owing to the refusal of Stefan George and Rainer Maria Rilke to allow the use of their poems, the little anthology compiled by H. Federmann, and entitled "Der Schatzbehalter" (imported by G. E. Stechert & Co.), is fairly successful in the attempt to bring together the most striking figures of that earlier period and a few of the most recent. Liliencron, Dehmel, Holz, Mombert, Dauthendey, Hofmannsthal, Schaukal, Greiner, Vollmoeller, and Ricarda Huch are well represented. The compiler wisely omitted poems by Liliencron that are already generally familiar, but included "Cincinnatus," the brave and helpful message whereof one cannot too frequently hear.

The refusal of Stefan George to be included in this modest anthology does not come as a surprise to any one who has watched his attitude of aristocratic isolation since his name first appeared

as editor of the *Blätter für die Kunst*. For that admirable magazine of poetry, in which he had the coöperation of Franz Evers, Karl Wolfskehl, Georg Edward, now a professor at the Northwestern University, and other men since distinguished in various departments of German letters, was designed for private circulation and for an exclusive taste. George was Germany's prophet of "art for art's sake" at a time when the cry for "vitality" and "truth" made poetry a handmaid of criticism and propaganda. While his idiosyncrasies of typography and punctuation were duly ridiculed, he was respected as one of the few who, in a time that clamored for realistic treatment of the tangible themes of every-day life, went his own way towards a purely artistic ideal.

"Der siebente Ring" (imported by G. E. Stechert & Co.) is representative of his art. He has revived archaisms and accepted provincialisms with amazing freedom, yet they never obtrude themselves unpleasantly upon the ear. His style is succinct and pithy, his images are striking, though a bit farfetched. He rarely attempts the lighter metres, but moves along with a solemn uniformity of measure and motion which might be fatiguing, were not the range of his subjects and his moods so large. But he stands aloof from the world's current in a field too exclusively æsthetic.

There is some affinity between Stefan George, a translator of Baudelaire, and Rainer Maria Rilke, who has done into German the "Sonnets from the Portuguese," and whose latest verse, "Der neuen Gedichte zweiter Teil," is now published by the Insel-Verlag of Leipzig. He, too, refuses to walk over well-trodden paths and to adapt his step to the measure of the multitude. He has ideas, and when he touches a subject previously written about, always strikes out a new meaning. His plastic touch can visualize a psychological problem, as in "Der Auszug des verlorenen Sohnes," or even a spiritual condition of the people, as in "Gott im Mittelalter."

Wolf Graf von Kalckreuth, the son of the painter Leopold von Kalckreuth, was known at his premature death as the translator of Baudelaire and Verlaine. Now a volume of "Gedichte" has been published by the Insel-Verlag and proves him a poet of distinction, though not of marked individuality. The sonnet-cycle dedicated to Napoleon contains some impressive imagery.

Readers familiar with the Young Germany of the nineties will greet with a touch of sadness the title-page which reads: "Leuchtende Tage: Neue Gedichte," von Ludwig Jacobowski (Egon Fleischel & Co., Berlin). It is proof of the poet's hold upon his people that these poems should be issued in a third edition eight years after his death. Although his social conscience was early awakened and the burden of the poor of all the world rested as heavily upon his shoulders as the burden of his race, Jacobowski did not share the defiant and challenging attitude of his comrades. His was a soul stunned rather than steeled by suffering, physical and spiritual, and the key of his song was a sombre minor. He won the sympathy of his people by simplicity of sentiment and by an unstudied form closely approaching the folk-song.

Bruno Wille, who had early joined the group of youthful iconoclasts in Berlin that made the modern school, and who later became the founder of the Freie Volksbühne, offers a selection from previously published volumes, with the addition of some new poems, under the title, "Der heilige Hain" (Eugen Diederichs, Jena). Above all his fellow-poets, Wille has the sense of nature and the open. He loves the intimate beauty of the pine groves of his Friedrichshagen home, and his walks with his friend Bölsche along the shores of the Müggelsee, historical as the scene of Hauptmann's "Einsame Menschen," disclose to him ever new sources of delight and comfort. He is by nature a worshipper and a preacher, and a gleam of humor breaks rarely into his solemn, reflective mood. Of his earlier poems one is pleased to meet again "Der ewige A b c Schütz," quaint and thoughtful, "Die Silberpappel," and "Wandervögel"; but misses "Mutter Erde."

Cæsar Flaischlen, who belongs to the generation of the Harts and the Hauptmanns, of Bölsche and Wille, came into prominence fifteen years ago through his drama, "Martin Lehnhardt," which summarized the individual rights claimed by Young Germany. But his attitude has since matured into a philosophical acceptance of things as they are, with an invincible hopefulness for the days to come. He goes toward "the divinity within" with cheerful unconcern for the bustling crowd about him. He insists in the preface to his "Zwischenklänge" (Egon Fleischel & Co., Berlin) upon the "Recht auf Zeit," without which the artist must lose his own kingdom. No winter is too long for him; for when the gray days of autumn come, he takes home with him the sunshine and the songs that summer gave, and cherishes the memory until the coming of another spring. This is the message of the "Stimmungen" and of the group entitled "Von Festtagen und Werktagen."

While Flaischlen has gradually developed a form of his own which lends itself effectively to proverbial verse, the most conspicuous among the late newcomers, Alfons Paquet, seems to have chosen Whitman as his model. His book, "Auf Erden," at first privately printed and now revised and enlarged, is published by Eugen Diederichs of Jena. It proves him to be essentially a poet of our day. He is equally at home in the solitudes of nature and in the press of city life. Nothing in the noisy bustle and strenuous struggle jars on him. His business training in London, his economic studies in the universities of Heidelberg, Munich, and Jena, and his travels in Asia and America have taught him to accept features of modern life that revolt his brother poets. He undertakes to interpret our time in verse, as the Dane Jensen does in prose.

Even among the women who have recently attained some prominence as writers of verse, there can be noticed a distinct deviation from the Frauendichtung, which had developed in the nineties. There are no such extraordinary figures among them as Maria Janitschek and Margarete Beutler, whose finer poetical qualities were obscured either by visionary symbolism or by their erotic note. Katharina Weise's "Aussaat" (imported by G. E. Stechert & Co.) compels attention as the work of a girl barely twenty, admitted by Carl Busse into his collection of Neue Deutsche Lyriker. The little book is distinguished by simplicity and sincerity, and shows not a few examples of fine imagery, as in the poem entitled "Heimliche Wittwen." Ricarda Huch is somewhat disappointing in the "Neue Gedichte" (Insel-Verlag, Leipzig). Still, they show her individual vision and the refinement and intensity of feeling that give an intimate charm to all her writings. The sonnets of Rosa Mayreder, "Zwischen Himmel und Erde" (Eugen Diederichs, Jena), manifest a rare intellectual aloofness. She wrestles with questions of conscience and problems of life, analyzes the relation between man and woman, and in one of the sonnets foreshadows a future not unlike the third kingdom of Maximos the Mystic in Ibsen's "Emperor and Galilean." But the most ambitious work is the epic poem, "Die Kinder der Lilith," by Isolde Kurz (imported by G. E. Stechert & Co.). Boldly deviating from tradition, she gives a new meaning to the ancient myth by making Lilith the heaven-born woman whom the Lord had given to earth-born Adam to keep alive in him the flame of ideal aspiration, while Eve has been created by the jealous Samael, otherwise Lucifer, to accomplish the fall of Adam. But the son to whom Lilith gives birth in heaven after the exile of Adam, falls heir to the mission she was to fulfill. The children of Lilith are the heroes, seers, and poets of the world that carry the torch of the ideal.

The safest sign, however, of the slow return to old ideals and old forms is the recent revival of the Ballade. With the exception of Liliencron, Carl Busse, Georg Edward, and a few others who never claimed seriously to be classed among the moderns, the poets of the

last decades have shown little liking for the form which was used so richly by Goethe, Bürger, Uhland, and Droste-Hülshof. It is by no means insignificant that two writers looked upon almost as regenerators of the lost art, Lulu von Strauss und Torney and Börries Freiherr von Münchhausen, spring from the aristocracy of their country. Chivalry, feudalism, and mediæval folklore have always been favored as subjects of the ballade, and it is only natural that poets of noble lineage should choose that form that best lends itself to the commemoration of traditions stored up in the family chronicles. Yet, without being an ultra-modernist, one must feel that the endless praise of feudal loyalty, the loves of pages and princesses and kindred themes of times gone by, are unfruitful anachronisms. The Balladen of Lulu von Strauss und Torney have in them more of the spirit of our time than do those of Münchhausen, though the popularity of the latter is by no means undeserved. It is evident from his "Balladen und ritterliche Lieder" (Egon Fleischel & Co., Berlin) that Münchhausen has mastered the form as has hardly another German poet of the day, even if he has not infused new life into the deeds of Ziska and Bayard, of the Beaumanoirs and the Montbijous. These Balladen and the lyrics in the second part of the book show as little relation to the standards set up by the Young Germany of the nineties as if that lively group of heretics had never attempted to "revalue old values." The Old World is, indeed, living at a rapid pace.

A. von Ende.

NEWS FOR BIBLIOPHILES.

On June 1 and 2 the Anderson Auction Company of this city will sell a miscellaneous collection notable chiefly for the large number (135 lots) of books by or relating to Oscar Wilde. Included are some very unusual and out-of-the-way editions of some of his books. First editions of Bret Harte, books relating to New York, books on the War of 1812, and Lincolniana are other classes represented.

On June 3 they sell the collection of book-plates formed by H. E. Deats of Flemington, N. J. This is one of the most extensive in the country, containing nearly ten thousand specimens. In 1894, Mr. Deats purchased the collection, about 3,500 plates, formed by James Eddy Mauran of Newport, who is said to have been the pioneer book-plate collector in America. The American plates, which are likely to attract the greatest interest, include specimens engraved by Paul Revere, Nathaniel Hurd, Alexander Anderson, Peter Maverick, and other early engravers, as well as extensive series of the work of the modern favorites, E. D. French, J. Winifred Spenceley, W. F. Hopson, and others. The introduction to the catalogue is by Charles Dexter Allen.

On June 2 the Merwin-Clayton Sales Company of this city will sell the autograph collection of J. E. Spannuth of Pottsville, Pa. Letters of Holmes, Lowell, Aldrich, Whittier, Halleck, and other American authors are included. On June 3 and 4 they will hold miscellaneous sales. In the sale of the later date is included a collection of book-plates engraved by E. D. French and others, books on book-plates, books from the Daniel and Roycroft Presses, first editions of Whittier and Oscar Wilde, and a series of fourteen first editions of Brander Matthews's books, each inscribed in the author's autograph.

A descriptive catalogue of the early editions of Shakespeare in the library of Eton College has been compiled by Walter W. Greg and published at the Oxford University Press. The collection of quartos includes twenty-two editions of eighteen plays bound in five volumes. Several are imperfect and others are described as poor copies. Ten, including two of the spurious plays, were printed before the appearance of the first folio in 1623. The first folio in the library is a small and inferior copy, with Ben Jonson's verses and title-page in facsimile. The third folio (with 1664 title) is also inferior, but the second and fourth folios are described as fine copies. The bibliographical descriptions are full and accurate. At the end a Critical Summary gives a list of the plays, which shows their location in the four folios, and, where they appeared earlier in print, notes the dates of the various editions in quarto.

It is reported by cable that the recently discovered volume made up of four of Caxton's books and bound, probably, in his workshop, described in the *Nation* for May 6, brought $13,000 at Sotheby's on May 21.

Correspondence.

THE NEW COPYRIGHT LAW.

To the Editor of The Nation:

Sir: I beg leave to enter a respectful protest against your editorial endorsement in your issue of May 20, of the violent and, I am sure, unjust characterization of the new copyright law by a radical German deputy, Dr. Heinrich Muller, as a "crazy potpourri of modern ideas and peanut protectionism." I do not know to what pernicious "modern ideas" Dr. Muller may refer, but he does not inspire confidence in his intelligence when he states that the law was "proposed" by President Roosevelt.

I am aware that the *Nation* has always held protection sentiment responsible for the manufacturing clause in the present law. In the memorable contest of 1891 much confusion existed in the minds of legislators concerning the protection afforded by the tariff and the protection afforded by the proposed copyright law. If a bill had been introduced to protect the White House by burglar alarms, it would have been opposed in certain quarters as a high tariff measure. The result was that at the last moment the bill lost a number of votes of friendly Democratic Senators who suspected that somehow they were being delivered into the camp of the enemy. May I say, very gently, that the *Nation* contributed to this result by its references to the bill as a protective measure because of the manufacturing clause, and that, in order to counteract this influence, Mr. Godkin was appealed to to write, and did write, a letter saying that the *Nation* was not opposed to the passage of the bill? This letter, I may add, proved of substantial value. Nobody ever doubted Mr. Lowell's position as an opponent of a high tariff, and yet he did not on this account waver in his advocacy of the only copyright legislation then practicable. It is most unfortunate that the subjects of tariff and copyright should be confused, and particularly that it should not be borne in mind that the influence that has secured and sustained the manufacturing clause is not protection sentiment, but the influence of the labor interests of the country in solid support of the International Typographical Union. You are at liberty, if you choose, to call the protective tariff and the manufacturing clause each a concession to a wrong conception of the interests of the American laborer, but beyond that, it seems to me, the identification is not reasonable, and only makes more difficult the task of liberalizing, not to say perfecting, our copyright statute. The fact that the new law was passed with unanimity in both houses was more than a personal triumph for Representative Currier and Senator Smoot; it indicated that in Congress the confusion with the tariff issues has virtually disappeared.

Again, I beg to remind you that so far as books in languages other than English are concerned, with one slight exception as to illustrations, the manufacturing clause is repealed by the law just adopted. In 1891 music and art were perfectly protected, as they still will be; but in the matter of books, we then unintentionally, indeed unwittingly, gave to non-English authors a "gold brick." The manufacturing clause kept them from obtaining practically the benefits theoretically offered by the law, so that since its enactment the average of such books entered for copyright has been not more than one a year. This disability was in the interest of nobody, and created for such authors a just grievance, and when the revision was undertaken four years ago the Council of the Authors' League set out to procure its abolition, and this has now been accomplished. In fact, with the slight exception of commercial lithographs and photo-engravings, the non-English author is in more advantageous position under the new law than the American, who must manufacture here. Dr. Heinrich Muller appears to be biting the hand that feeds him.

I am not intending to discuss here the more or less important defects of the law—some of which are real and some imaginary, and most of which experience will remedy—but to set forth some of its advantages. To include those already mentioned, they are:

(1.) Extension of the time of security from forty-two to fifty-six years for every existing as well as every future copyright—including, of course, all foreign authors, artists, and composers. A liberal provision of vast importance.

(2.) Abolition of all manufacturing restrictions on the original text of books of foreign origin in languages other than English. This is ideality incorporated in law.

(3.) Abolition of the manufacturing clause for foreign photographs.

(4.) Ad interim term of sixty days for

English authors without prejudice to their American rights. This, in some measure, meets the objection that the manufacturing clause is particularly hard on an English author's first book.

(5.) Full recognition of the right to renew copyrights in composite works. This important question has been much in doubt.

(6.) The requirement of but one copyright notice for magazines and other composite work. This point has never before been legally determined.

(7.) First legislative declaration in America that the copyright does not go with the sale of a work of art.

(8.) Abolition of the requirement of a disfiguring copyright notice on the face of paintings and engravings.

(9.) Extension of the number and character of copyrightable articles.

(10.) Fair adjustment of the amount of damages, with discrimination between intentional and accidental infringement.

(11.) Clear definition of legal procedure.

(12.) Simple and explicit declarations relating to the formalities of copyright.

(13.) Unification of the variety of terms first proposed.

(14.) A provision, however inadequate, by which musical composers may obtain compensation for the use of their works on mechanical instruments.

(15.) The declaration that copyright is not forfeited by accidental errors in the notice.

Incomplete as it is, this must be confessed to be a remarkable record.

Let us remember that it is less than twenty years since the most flagrant piracy of intellectual works flourished in this country without legal hindrance, and that, although the bill does not accomplish all that was desired, it was most important that Congress should go on record in favor of longer and stronger security. It is much to be regretted that when our law-makers have taken such an important step forward their work should not be greeted with appreciation. It is said that republics are ungrateful, but there ought to be one exception in the republic of letters, and I am sure that authors and other owners of copyright property in this country do not lack appreciation of the patient, devoted, and laborious efforts of the Joint Committees of Patents to provide a liberal and progressive copyright statute.

As for foreign sentiment, that it is not adequately represented by Dr. Muller's speech, will be evident when it is stated that I have received from officials or copyright authorities of Germany, France, Switzerland, Italy, Denmark, Mexico, and Japan, appreciative letters of thanks for the action of the Council of the Authors' League in championing the modification of the manufacturing clause. We were under the impression that the removal of the just grievance of friendly nations, which was a source of exasperation to them, and of shame to us, was a service to the country, as well as to the profession of letters—justice being (in international dealings) as much better than arbitration as arbitration is better than war.

ROBERT UNDERWOOD JOHNSON,
Secretary of American (Authors') Copyright League.

New York, May 21.

[Allowing for all that our correspondent points out, it remains true that the United States yet continues apart from the civilized nations which, through the Berne Convention, assure to foreign authors and artists perfect equality with native.—ED. THE NATION.]

THE BIRTH OF A LEGEND.

TO THE EDITOR OF THE NATION:

SIR: Students of history are familiar with many instances in which the mention of an important event, or of essential details concerning it, will suddenly appear, for the first time, in chroniclers centuries later than its assigned date. The real "source" may be nothing more than a late poetic creation, or even a deliberate and malicious forgery; yet it is often most difficult to strip off such accretions from the authentic account. A curious illustration of this is, even now, in the air all about us.

The craze of the hour is the "Marathon race." The most familiar name among all Greek heroes to-day is—Pheidippides. The Information Bureau of every newspaper is supplying inquirers with spirited accounts of the first battle for freedom against the Persian invaders, followed by the tale of the patriotic sprinter who takes back to Athens the news of victory, and drops dead as he pants out the words: "Rejoice! We win!" Even as a teleological myth, this is hardly a success. At least, it gives no encouragement to defenders of the heart-breaking long run.

A brilliant university professor of history asked me the other day for the Greek source of this tale, saying he couldn't find it iu Herodotus. To be honest, I expressed surprise, and at once promised to point out the chapter! And yet, a dozen years ago, in a paper on Robert Browning, it had been asserted that the nineteenth century poet invented the whole incident.

The case is such a startling one, that we hope some classical man, within reach of a large library, will verify the statement. Pheidippides is authentic enough, and he did make a creditable "cross-country run," over vile roads, to summon aid from Sparta, on the first news of the Persians' landing. Herodotus records the legendary addition, that the great god Pan stopped the courier in an Arcadian dell, reproached the Athenian folk for ignoring him in their state cult, but promised them aid when most needed. This pledge was fulfilled by the "Panic" fright which turned the tide on the plain of Marathon. "No more but so."

No martyr-messenger was needed: the whole army returned the same day to Athens. An attentive study of Browning's poem, especially when compared with his avowed recasting of the Alcestis legend in "Balaustion"—not to mention William Morris's far more unfilial treatment of the same heroine in "The Earthly Paradise"—will probably convince the critics that no deception was intended. The colophon is offered by Browning himself as a fit though wholly imaginary crown for an heroic life. The spirit of it all is Hellenic and Herodotean, though not the letter.

But the weight of general belief is so strong, that the present writer is even now afraid he is betraying scandalous ignorance of some *locus classicus*. The two Greek words that head the poem χαίρετε, νικῶμεν! seem to wake a far-away echo in memory. But even if some late Greek gossip, like Athenæus, did declare (as Browning does), that the use of χαίρετε as a greeting dates from this use of it by Pheidippides, that, in any case, is both untrue and absurd. "Every schoolboy knows" that the Homeric heroes hail each other with the bidding, Rejoice. W. C. L.

Scranton, Pa., May 17.

THE TWO WILLIAM SHIRLEYS.

TO THE EDITOR OF THE NATION:

SIR: William Shirley, born in England in 1694, reached this country in 1731, became Governor of Massachusetts in 1741, and died at Boston, April 24, 1771. His public career in America is too well known to need comment. Contemporary with Gov. Shirley was another William Shirley, who wrote several pamphlets and plays, among the latter "Edward the Black Prince," "Electra," and "The Birth of Hercules" (in the British Museum Catalogue amusingly misprinted "The Bath of Hercules"). He died about 1780.

Although these two William Shirleys are, as might be expected, carefully differentiated in the British Museum Catalogue, and although there is a notice of each in the "Dictionary of National Biography," yet by American bibliographers, biographers, and historians they have been confused, and the above mentioned plays of the dramatist have been attributed to the Governor. Thus, in the printed "Index to the Catalogue of Books in the Bates Hall" (1866) of the Boston Public Library, and in the printed "Catalogue of the Boston Athenæum," Gov. Shirley is made the author of "Edward the Black Prince." Again, in the second edition (1832) of his "American Biographical and Historical Dictionary," William Allen appended to his notice of Gov. Shirley the following sentence, not found in the first edition (1809) of that work: "He published 'Electra,' a tragedy, and 'Birth of Hercules," a masque, 1765." This statement has been repeated by E. B. O'Callaghan in "New York Colonial Documents" (1855), VI, 959, note; in Allibone's "Critical Dictionary of English Literature" (1870); in Drake's "Dictionary of American Biography" (1872); by R. A. Brock in "Dinwiddie Papers" (1883), I, 70, note; in "Appleton's Cyclopædia of American Biography" (1888); and in Oscar Fay Adams's "Dictionary of American authors" (1897). There is nothing in Allen's work to indicate how he came to be misled in this matter, but perhaps it was through Dr. Robert Watt's "Bibliotheca Britannica," published in 1824, where (II, 853*r*) two pamphlets by or relating to Gov. Shirley, and one pamphlet and two plays by the dramatist, are all entered under the single name of "William Shirley."

Finally, attention may be called to a statement in E. P. Shirley's "Stemmata Shirleiana" (1873), where we read of Gov. Shirley that "He was a good classical scholar, and is said to have written several papers in the *Spectator*" (p. 319). Steele's *Spectator* ran from March 1, 1711, to December 6, 1712, while Addison's continuation ran from June 18 to December 20, 1714. The exact date of Gov. Shirley's birth—December 2, 1694—was first pointed out by

Charles K. Bolton of the Boston Athenæum in the "Publications of the Colonial Society of Massachusetts" (VIII, 243). Is it probable that any papers in the *Spectator* were written by a youth between seventeen and twenty years of age?

ALBERT MATTHEWS.

Boston, May 17.

THE DEMOCRATIC PARTY.

TO THE EDITOR OF THE NATION:

SIR: The *Nation* in this issue (May 20) prints a communication from Spokane on "The State of the Democratic Party," which, as an independent Democrat, I have read, marked, learned, and endeavored to digest.

I quite agree with your correspondent that the "Bourbon South" has for years been the bane of the Democratic party, and more than any other element has tended to reduce the electoral vote of the same. Nor can I, as one not "endorsing the Rooseveltian output of economic error and ignorance," deny what he says concerning "the abject subserviency to any crooked interest that will contribute to its campaign fund" of the Republican organization. "The visionary nonsense of Debs and his disciples" never appealed to me, and your correspondent is a Daniel when he says that deprived of those who, by "Southern renegade protectionists" and in general by the "aristocratic, labor-despising, and privilege-seeking South," are compelled to vote with it, the Socialist party "would be reduced to a handful of half-cracked extremists, whose ravings would disturb nobody." And though "it is a foolish waste of time," I enjoy seeing depicted in true colors that "blatant, cynical, and corrupt aggregation of political mercenaries" which is willing to "trade off the national ticket for a New York Governorship."

For the ills of "sectionalism, lack of any definite or coherent policy, endorsement of wild-eyed economic vagaries, like Mr. Bryan's," there seems to be one remedy. Let your correspondent summon all "broad, national, sane, radical, and progressive" Democrats to convene at some central place—such as Spokane—and there nominate some regular Democrat who has voted for Bryan and for Parker, and who, having been a worker in the ranks, will not fail to speak out in the assembly. Let him not wait for the existing organizations of corruption and of folly to convene; but let him do so next year, in the early spring, on the kalends of April.

Should he do this, as said the Achaian warrior, "τίν' οὐ πείσεσθαι ὀίω."

EDWIN B. KING.

Ridgefield, Conn., May 20.

SOCIOLOGY—A REJOINDER.

TO THE EDITOR OF THE NATION:

SIR: In your issue of last week, Prof. Ellwood made an impressive statement of the high hopes and great expectations of sociology, but all this is nothing to the point. Timo was when astrology inspired like interest on similar grounds. In Evelyn's "Diary" political commotions then taking place were ascribed to the influence of the comet of 1618. Astrology sought to forecast the range and extent of that kind of influence. Very likely, if some one, in its day, should have ventured to say that it was a humbug, its adherents would have replied by expatiating upon the importance of its aims, and thus it might have been said of astrology, as Professor Ellwood says of sociology now, "He who opposes astrology as such is unconsciously an enemy of mankind."

The point at issue is not whether sociology means well, but whether it is true. The line of defence which Professor Ellwood adopts illustrates what I noted as a characteristic of the sociologists, the way they have of imputing to their projects the merit of their motives. The point I tried to drive home is that people ought to be on their guard when anything is urged in the name of sociology, for as matters stand there is no such science. Whether there ever will be a science of sociology is a debatable proposition, and it is on this that issue is joined. With this statement the case may rest in the columns of the *Nation*. Those who may be interested in the technical details into which further discussion must enter may consult the *Journal of Sociology* published by the University of Chicago. I am advised by its editor that the subject will be treated in its columns, with allowance of space for the argument on both sides.

HENRY JONES FORD.

Princeton, N. J., May 24.

READINGS IN TENNYSON.

TO THE EDITOR OF THE NATION:

SIR: Besides the British Museum "trial copy" of Tennyson's "Enid and Nimuë: The True and the False," referred to by Mr. Rolfe in his interesting letter printed in the *Nation* of May 5, two more are known. One of these is at South Kensington Museum, bound in with "The True and the False. Four Idylls of the King," and the other is in my possession. I have also a trial copy of "The True and the False," which is earlier than that of the South Kensington. In it appears still another variant of the passage, of which Mr. Rolfe quotes four readings. It reads thus:

She hated all the knights, and heard in thought
Their scornful laughter when her name was named.
For once, when Arthur, walking all alone
Vext at a rumor rife about the Queen,
Had met her, etc.

The three known copies of "Enid and Nimuë: The True and the False" (1857) and the two of "The True and the False. Four Idylls of the King" (1859) are described by Mr. Thomas J. Wise in "Literary Anecdotes of the Nineteenth Century" (1896) and in his exhaustive "A Bibliography of Tennyson" (1908).

The poem "Kate," which first appeared in "Poems," 1833, is reprinted in "Complete Works," 1895, p. 24, and again in "Complete Works," 1900, p. 24.

Mr. Rolfe will find in the "Memoir," volume II, p. 383, the following lines inscribed by Tennyson in a copy of his works to be presented by the Royal Guild of Nurses of England to Princess Louise Augusta of Schleswig-Holstein on her marriage:

Take, Lady, what your loyal nurses give,
Their full God-bless-you with this book of song,
And may the life, which heart in heart, you live
With him you love, be cloudless and be long!

W. H. ARNOLD.

Nutley, N. J., May 14.

WHO CARDELIUS WAS.

TO THE EDITOR OF THE NATION:

SIR: "B." asked in the *Nation* of April 1, "Who was Cardelius?" He was answered by Robert Restieaux on May 6, and again by Harmon Karl on May 13. These answers tell us nothing that is true about Cardelius. All the truth about him is told in this letter of mine. Restieaux and Karl are evidently scholars; just as evidently they are poets. We could not pardon them for being so eager to tell us what they wrongly thought they had gathered from their books, if they had not told it so well. Once more poetry is justified of her children. The Cardelius of M. Restieaux, learned in Latin, book-worms, and garlic, and the Cardelius of Herr Karl, beloved of Keinmensch and devoted to sorrel—these are better worth having on our list of authors, are better subjects for scholarly controversy, and are quite more lovable characters than the Cardelius from whom and by whom came the now famous quotation, "And this our noble art of Printing, etc."

Cardelius is a child of the imagination; rather, he was born of the union of a printer's composing-stick and a font of 60-point Cheltenham.

In our library we have an old Washington hand press and a couple of fonts of large type. With these, manipulated by a small boy, we print signs for our shelves, notes and suggestions to readers and borrowers, and posters descriptive of the many meetings and exhibitions held in the library. I have always been slightly typographic, from the days when our village printer's shop was just across the street from home, down through the times when I was all things to the Ashby *Avalanche*, a splendid hand-wrought Western country weekly which I am afraid you never saw, and on to twenty years of dealing with books in a library.

Being fond of types and of the smell of printer's ink I naturally spend parts of my holidays and of long New Jersey winter evenings in playing with our library press. Several months ago I composed a brief thought, a one-line hymn, to the printer's art I so much admire, and set it and printed it on our press. It was long enough for a thought; but it did not compose well in 60-point type. I did not care to say more, but for purposes of typographic display I wished more to be said. And so, with my stick in my hand, I stood before the case and added words to words. If you know the ways of types, you know that they will not yield a fraction of an inch to carry, within the limits of the measure your composing-stick gives you, the words you have chosen for the thought you wish to express. For the length of line I had selected I found at last a heading, "This our noble art," which when set in capitals fitted it exactly. From this I went on, adding a word here, dropping one there, changing this phrase and that, shifting capitals and small letters, escaping hyphens and other pitfalls, until I had produced from my original humble sentence the Delphic utterance which "B." quoted in his letter. As it came slowly into good typographic form, I found it by chance had taken on a slightly archaic flavor. I nursed this a little. When it was nearly done, I said to myself, "This needs a half line of 30-point at the bottom for a balance, and needs also an author fit to have said this

thing and well able to have said it in this way. Let him be unknown; let him be early; if I say he wrote in Latin I shall have just the length of line in 30-point that I need. What is a good name for a Latin author of early printing days?"—and then came Cardelius. I never heard of him before. I cannot find him in the books. If it was wrong to invent him, the sin must be laid on the Devil, which has always been in types.

Since "B.'s" note appeared, the *Inland Printer* for May has come to us with this one and only sentence of the hitherto unknown Cardelius skilfully written out by hand and elaborately decorated for its frontispiece. This is natural and proper. If the craftsman saw a sentence from Cardelius, of the sixteenth century, quoted somewhere, it was his right to quote it again. I hope the *Inland Printer's* editor will not think less well either of the style or substance of the quotation when he learns that it came from an amateur in his own art and not from a wise man of the sixteenth century. Indeed, if the thought and the words are good, where could they appear more appropriately than in the pages of a journal which preaches so excellently as does the *Inland Printer* the gospel of good printing?

J. C. Dana.

Newark, N. J., Free Public Library, May 21.

HEINE AND THE NEGRO.

To the Editor of The Nation:

Sir: In view of recent discussions of our negro problem it may be interesting to quote a few words from Heine, of whom it has been said: "Throughout his life he stood in the front ranks of those who fought for liberty. . . . This sentiment for liberty runs through all his prose writings like a red thread and is simply incontestable." It was in 1830, if I am not mistaken, that Heine, alluding to conditions in the New World, expressed the following sentiment:

> Actual slavery, which has [now] been abolished in most of the North American provinces, does not arouse in me as much indignation as does the brutal treatment to which the free negroes and mulattoes are there subjected. Whoever is even a most remote descendant of a negro . . . must suffer the greatest humiliations—humiliations which to us in Europe seem simply monstrous.

Even to-day, as I know from personal contact with Europeans, one may sometimes hear them confess their inability to comprehend the strong anti-negro sentiment which still largely obtains in certain sections of our country.

C. H. Ibershoff.

Cornell University, May 12.

A CORRECTION.

To the Editor of The Nation:

Sir: An American correspondent has kindly informed me that my name appears in large type under the head of "Officers, Advisory Board, Faculty and Special Lecturers" in the catalogue of what calls itself "La Salle Extension University, Department of Business Administration." Will you kindly allow me to state that I have not the slightest connection with this enterprise, the existence of which was quite unknown to me, and that I have given no authorization to anybody to use my name in any such connection.

W. T. Ashley.

University of Birmingham, England, May 14.

THE PLEONASTIC SO.

To the Editor of The Nation:

Sir: Even carefully edited publications constantly offend good usage by printing a pleonastic *so* in sentences like the following: "The face has patience, a quality so little looked for from Hals." Let me ask your aid in protesting against this offence of good usage.

A. H.

Rome, May 2, 1909.

Notes.

Putnams announce for immediate publication the important volume on "Darwin and Modern Science," edited by Prof. A. C. Seward for the Cambridge University Press. This book, commemorative of Darwin's centenary, contains twenty-nine essays by various eminent philosophers and men of science.

James Douglas, who has already published a monograph on Theodore Watts-Dunton, has for two years been working at a similar study of Swinburne, which will be brought out by Methuen & Co. It will be critical rather than biographical. The official biography of the poet is to be written by Mr. Watts-Dunton, to whom all of Swinburne's letters and manuscripts have been bequeathed.

Miss E. S. Haldane and Mr. G. R. T. Ross have made a complete translation of the philosophical works of Descartes, which will be issued, probably in the autumn, by the Cambridge University Press. Miss Haldane, a sister of the Minister of War, has already published "The Life and Times of Descartes," and a translation of Hegel's "History of Philosophy." Mr. Ross is a member of the faculty of Hartley University College, Southampton.

Kipling's "Just So Stories" has been issued in the excellent limp-leather edition of Doubleday, Page & Co. The type and paper, as in the earlier volumes of this set, are notably good, and the book is in every respect pleasant to handle and read. The form has most of the advantages and none of the disadvantages of the so-called thin-paper editions.

A new edition of "Practical Golf," by Walter J. Travis (Harpers), has its main recasting, from the issue of eight years ago, in the chapter on balls. That on hazards might have been overhauled to advantage, in view of recent developments. The 1909 golf rules are given in an appendix.

A unique publication of considerable historical value and scientific interest is "The Bell Telephone" (American Bell Telephone Company, Boston). It is the deposition of Prof. Alexander Graham Bell, the inventor, made in 1892, in the suit brought by the United States to annul the Bell patents, together with a full report of his cross-examination. The suit, we may add, was practically abandoned by the government, the Bell patents having been sustained by the United States Supreme Court. The value of the book lies in the fact that it is a detailed and well-arranged statement of the inventor's work from the beginning. This was very early in his life, for from childhood, "my attention," he says, "was specially directed to the subject of acoustics, and specially to the subject of speech"; and when only a boy he made a speaking machine which was able to articulate a few words. His first professional work was teaching his father's system of "visible speech," and teaching speech to deaf mutes. A portrait of Professor Bell is given, together with reproductions of many of his drawings and pictures of various instruments.

A double section of the "New English Dictionary," prepared by Dr. W. A. Craigie, carries forward Volume VIII from Ribaldric to Romanite. Within these narrow limits, where Johnson's wide-meshed net caught only 216 words, with 764 quotations, the fine seine of the latest lexicographer brings up 3,161 words and 17,677 quotations. The difference is striking, because barbarian importations and new popular and scientific coinages are comparatively few in this number, whereas the native English element is large. Of course, many of the words familiar to Robin Hood and Robin Goodfellow—whose first appearances in the literary world are here recorded—have been put to unfamiliar uses even since Johnson's time. Yankee ingenuity, for example, grafting the base of a cradle upon the legs of a chair, made the word Rocker, formerly a symbol of rest, carry also the suggestion of American restlessness. And there is something that reminds us of Johnson's definition of oats in the quotations under Rocking-chair—just a faint flavor of national satire. The first is from Mrs. Trollope on "American Manners," 1832: "They . . . sit in a rocking-chair, and sew a great deal"! The second is from Bain, 1855: "The rocking-chair, introduced by the Americans, . . . is another mode of gaining pleasure from movement." In revenge it is some comfort to note that a certain clever device for utilizing the last square inch of linen in a hand towel was not "made in America" by a utilitarian Franklin, but in England, presumably by some mechanical genius now lost in the night of memory. For in the "Early English Wills" there is to be found this tender testament, under the date of 1434: "Y bequethe my roller for a towell to Margery Bokeler."

Before philological doctors presided at the birth and watched over the growth of English speech, strange corruptions, as every one knows, took place in the forms of many words. Two interesting examples of popular etymologizing are included in this section. The first is the word Riding, applied to the divisions of a country, as the east, west, and north ridings of Yorkshire. In the earliest forms the word, of Scandinavian origin, meant clearly a three-ing, or one of three divisions; but after long association the final *t* or *th* of east, west, or north stole the initial consonant of the following word, and, for the popular mind, invested a simple mathematical abstraction with a rich penumbra of equestrian associations. A similar change for the richer was that which converted the Old English Rodlon, defined by Lydgate as "a whirle wynde blowing nothing softe," into Rodges—and

later into Roger's blast, a term still heard in parts of England to-day. Another interesting Roger is he of De Coverley, who gave his name to an old Lancashire tune and dance, and later to Addison's hero. The earliest instance of the word noted is Roger of Coverly, 1685, as the name of a tune. In Heywood's "A Woman Killed with Kindness," 1603 (Act I, scene ii), a play set in the north of England, Rogero appears as the name of a country dance, popular among servants. May not this be Roger of Coverly? At any rate, here is a word that has escaped the fine meshes of the "New English Dictionary." Americans will be glad to know, however, that their contribution to natural history, the ring-tailed roarer of Kentucky, has not been omitted. But was not the ring-talled roarer of Pike County, Missouri, even more celebrated?

"The Evolution of Modern Germany," by W. H. Dawson (imported by Charles Scribner's Sons), is an Englishman's attempt to show his fellow-countrymen the stupendous change which has taken place in the economic life of Germany in the past fifty years. The author is already well known by excellent books on Lassalle, Bismarck, Socialism, and Protection, some of which have been deemed worthy of translation into German. In this volume, however, he is riding no hobby and propagating no gospel, but giving a sane and mature judgment on the causes of Germany's present position. In these days of British susceptibility at German ascendancy it is refreshing to find such cool objectivity. None of his conclusions are of startling novelty, and most of his data are accessible to the student trained in the use of statistics. But the legislator, the merchant, or the teacher, who is not so trained and for whom figures have no fascination, cannot find a more satisfactory and stimulating explanation of the increasing severity of German competition in industry and commerce. The German manufacturer outrivals his competitor because he pays lower wages and is content with smaller profits. He runs his plant more hours in the week. He studies more carefully the needs of those whom he wishes to make his customers; instead of telling them to take what they are offered or nothing, he makes what they want. He does not expect foreigners to be expert in the German language, but addresses them in their own tongue. The Germans were the first to appreciate and apply technical training to industry; it is estimated to-day that in the chemical factories of Germany there is on an average one university-trained chemist to every forty workpeople, a ratio of science to labor probably not equalled in any other country. The remarkable increase in population, greater than ever before, and amounting now to a million a year, is explained partly by decrease in emigration and in infantile mortality. The Germans have outgrown the idea that a high infant death-rate is a wise provision of Nature to weed out the "unfit"; they think that to regard infants who die from poor artificial feeding or foul air as predoomed by necessity, is as sensible as to condemn as "unfit" the child who is thrown out of the window by a drunken mother, or who is burned in a locked room. Thus, there have arisen, in the interest of the infants and of the nation, dispensaries, hospitals for mothers and infants, a scientific institute for research in "infantile hygiene," and the multifarious crusading activities of the Women's Patriotic Society. In addition to these chapters on his main theme, the author has a good discussion of the outlook for Socialism, the Polish question, and the new colonial era under Dernburg's influence. The chapter on the creation of small agricultural holdings is of special interest in view of England's recent act of Parliament for the same purpose, to the execution of which the county councils are offering such vigorous objections.

Prof. Edward T. Devine's "Misery and Its Causes," the third volume to appear in the Macmillan Company's American Social Progress Series, purposes "to articulate a new social philosophy, pragmatic, economic, and socially adaptable to the existing conditions of American life." Stress should fall, however, upon the articulation, rather than upon the novelty of its facts or programmes. To one familiar with organized charity work, the book may let in little fresh light; but it certainly helps clear the air. In recent years, the zeal of our social architects has obscured their plans. They have been remodelling so many things, investigating so many more, and clamoring for such a multitude of costly improvements, that even their well-wishers are talking about tinkers and dreamers. While searching the roots of misery, Professor Devine allays these fears. Briefly and clearly he marks the current in the welter. The ills that flesh is heir to are few; those that it purchases with ignorance are many. Human nature is not depraved, it simply has not found itself. Character, the strengthening of which is our supreme aim, is to be won in fullest measure, not by removing temptation, but only through education and economic opportunity. These include ten special needs: sound physical heredity, protected childhood, a prolonged working period (say, until well past sixty), freedom from preventable disease, the elimination of professional crime, insurance against all ordinary contingencies of life, elementary schooling adapted to present-day needs, a liberal relief system, a standard of living high enough to secure the elementary necessities, and, finally, religion. Such blessings will not come at the word; there are too many pipers to pay. But come they must, because "they do not represent the indulgence of altruistic sentiment. They are investments. Large expenditures may be required, but they are required as capital. They take the place of larger expenditures and greater burdens." This philosophy, based on statistics, must be judged by figures. Professor Devine's most convincing chapters analyze the disabilities of five thousand families lately assisted by the New York Charity Organization Society; the instances are well selected, and are in themselves persuasive, but they leave open one point of attack. In a few generalities he dismisses the cost of reform; and yet this is precisely the crucial question just now. It is all very well to convince us that misery is preventable, and that money spent to avoid it is money invested; but even the General Reader, whom the book addresses, is business man enough to know that investments must be regulated, first of all, by the number of dollars in purse, and then by the relative urgency of life's many wants. A social philosophy which has not reckoned its budget is an unfinished sentence.

In his latest volume, "The Living Word" (Moffat, Yard & Co.), the Rev. Dr. Elwood Worcester confesses to enthusiastic admiration of Gustav Theodor Fechner, the Leipzig psychophysicist. He says:

> It is doubtful if Europe, during the century of its greatest philosophical activity, produced a profounder or more fruitful religious thinker. . . . The greater of Fechner's works can be compared only with the sacred books of the nations. They are inspired, and they contain a true revelation of God.

Dr. Worcester reproduces in popular form the spiritual idealism of Fechner, especially of the "Three Motives of Faith." Aside from the traditional, practical, and rational motives for belief in God, the essay deals chiefly with the grounds for belief in a spiritual interpretation of the universe, and with the basis for faith in immortality.

In his little volume, "Aspects of Christian Mysticism" (E. P. Dutton & Co.), the Rev. W. Major Scott professes to offer the reader nothing more than an introduction to the field. For this purpose brief studies of the teaching of some of the famous Christian mystics are presented, beginning with the writings of St. Paul, St. John, and Clement of Alexandria. Then follow short discussions of Dionysius the Areopagite, Master Eckhart, Ruysbroeck, Suso, Tauler, St. Theresa, St. John of the Cross, Jacob Behmen, and Peter Sterry, the Cambridge Platonist. Their teaching is given as far as possible in their own words. In his treatment of mysticism the author is quite uncritical. He fails to recognize, for example, the abnormal element which almost invariably attends the more pronounced types of mystic experience, the nervous instability and the depression, often intense and protracted, by which the devotee purchases the moments of emotional exaltation.

There has been a great want of good books in English on the history of Jewish religion in the ages immediately preceding the Christian era. Especially have English readers been unfamiliar with the apocalyptic movement and its important consequences for Hebrew piety. The monumental work of Schürer, "History of the Jewish People in the Time of Jesus Christ," translated from an edition going back as far as 1886, has been beyond the reach of the average student. The treatise of Bousset on Judaism in the time of Christ, "Die Religion des Judentums im neutestamentlichen Zeitalter," which perhaps has done more than any other book to open the eyes of many to the importance of a knowledge of late Judaism, is still untranslated. No scholar of any nation has done more thorough work in this field than Prof. R. H. Charles of Dublin, but his works can not be said to be popular. A good book is now available, scholarly but not too technical, in the Rev. William Fairweather's Cunningham Lectures at Edinburgh, on "The Background of the Gospels, or Judaism in the Period Between the Old and New Testaments" (Scribner). Mr. Fairweather has been a careful student of the literature of the subject, his historical judgment is prudent, and he shows good sense in hand-

ling his facts. One notes constantly the influence of German authors, yet it is clear that the writer has worked through his subject. After an excellent description of "the fundamental characteristics of Judaism," he traces both the fortunes of the nation and the development of Jewish piety through the pre-Maccabean period, the revolt of the Maccabees, the rise of the Jewish parties, the age of Herod, and the period of the dispersion. Especial attention is paid to the apocalyptic movement and literature.

A selection from the works of Julius Grosse, one of the most prolific novelists and dramatists of the past generation, is published in three volumes by Alexander Duncker of Berlin. Dr. Josef Ettlinger of the *Literarische Echo*, Hans von Gumppenberg, Fr. Muncker, and Adolf Bartels are the editors, and the last-named has written the biography.

The Deutsche Verlagshaus Bong & Co., in Stuttgart, has recently published new editions with introductions and annotations of the works of Ludwig Achim von Arnim and Adalbert von Chamisso. The editor of the Arnim edition in two volumes is Dr. Monty Jacobs, dramatic critic of the Berliner *Tageblatt*. The Chamisso in one volume is edited by Dr. Max Sydow.

A book which defies classifying and labelling has come from the pen of Gerh. Ouckama Knoop: "Aus den Papieren des Freiherrn von Skarpl" (Egon Fleischel & Co., Berlin). The author, who is ranked among the cleverest and most serious novelists, now appears in the rôle of a Juvenal of modern Germany. He begins his random paradoxical remarks with an attack on the worship of success and on the general lowering of standards. He asserts that there is no longer any distinction in rising, since eminence is associated with plebeian qualities. He ridicules the aping of the military pose by judges, clergymen, and merchants, whom military service has keyed up to the *Leutnantston*. The mimicry of English customs comes in for a share of censure, for while these are spontaneous with the British, they are studied and factitious with the people of the Continent. The exaggerated luxury of restaurants intended for the accommodation of the multitude is to the Freiherr as much a mark of bad taste as the ocean liner fitted out like a royal palace and filled with a crowd of commonplace tourists. He disapproves of the attempts to force European culture upon nations having a civilization of their own, asking why Mandarins should play golf and negroes use odol? But his point of view becomes most individual when from generalizations he turns to the characterization of some of the figures prominent in modern Germany. It is altogether a remarkable book, though its sarcasm may not afford unalloyed pleasure.

A book full of valuable information to the general reader and to the tourist ambitious of making Alpine ascents is "Der Alpinismus und der Deutsch-Oesterreichische Alpenverein," by Dr. A. Dreyer (Berlin: Marquardt & Co.). It is a volume of nearly two hundred pages containing the history of the conquest of the Alps by hardy climbers from antiquity to the present time. The first to make an Alpine ascent was the poet Petrarch, who, in 1336, succeeded with his brother, in scaling the Mont Ventoux near Vaucluse. In June, 1492, the steep and rocky Mont Aiguille, near Grenoble, was scaled by a Frenchman, with the aid of ropes and ladders. But to English tourists of modern times is given the credit of having been the most daring and successful climbers. The Alpine Club, founded in 1857, by William Matthews and E. T. Kennedy, and immediately joined by John Ball and other well-known Alpinists, is credited with being the predecessor of the German and Austrian societies, to the work of which the latter part of the book is devoted. In the review of Alpine literature, too, there is a respectable group of books by English writers beginning with the Bishop of Salisbury's account of his travels in Switzerland in 1685 and 1686. The book is profusely illustrated with views of famous peaks and portraits of popular guides and prominent Alpinists.

The Académie des Inscriptions et Belles-Lettres has announced its annual awards. The Prix Brunet (3,000 fr.) has been divided among Philippe Renouard for his bibliography of books printed by Josse Badius, M. Briquet for his "Dictionnaire historique" of watermarks on paper, L. Nardin for his monograph on Jacques Foillet, and H. Stein for his "Bibliographie générale des cartulaires français." The Prix Stanislas-Tulien (1,500 fr.), for the best book on China, is given to A. Stein for his "Ancien Khotan."

Miss L. M. Little, well known in Irish literary society, has died at Dublin. She wrote frequently for the magazines and published two books of verse, "Persephone" and "Wild Myrtle."

Robert Nisbet Bain, assistant librarian of the British Museum since 1883, has died at the age of fifty-four. He was a specialist in Scandinavian and Slavonic studies. Among his published works are: "Gustavus III and his Contemporaries," "Hans Christian Andersen: a Biography," "Charles XII and the Collapse of the Swedish Empire," "The Pupils of Peter the Great, 1697-1740," "The Daughter of Peter the Great: a History of Russian Diplomacy under the Empress Elizabeth Petrovna, 1741-62," "Peter III, Emperor of Russia, 1762," "Tales from Gorky, with Biography," "Tales from Jókai, with full Biography," "Scandinavia: the Political History of Denmark, Norway and Sweden, 1513-1900," "The First Romanovs, 1613 to 1725: a History of Muscovite Civilization, and the Rise of the Modern Russian State," and "Slavonic Europe: the Political History of Poland and Russia from 1469 to 1707."

STUDIES IN ENGLISH HISTORY.

Lollardy and the Reformation in England. By James Gairdner. 2 vols. New York: The Macmillan Co. $6.50 net.

In the final chapter of his admirable study of England in the age of Wycliffe (1897), G. M. Trevelyan called attention to the hitherto unsolved problem of the relation between the religious movement in Wycliffe's time and the formal accomplishment of the English Reformation under Henry VIII. Since then Abbot Gasquet in his "Eve of the Reformation" (1900) has made his contribution to the same question from the side of the Roman Church. He took naturally the position that Lollardy had been repudiated by the sound sense of the English people and that the breach with Rome was caused, not by any widespread, latent discontent with the papal system, but by a new wave of religious influence, chiefly Lutheran, combined with the immediate ambitions of a lustful and bloody tyrant.

Mr. Gairdner, a veteran in sixteenth century studies, approaches the same subject from a somewhat different point of view, but with results not essentially different. He calls his book an historical survey, and his aim is to present in chronological sequence the various stages of the Reformation process from Wycliffe to the death of Henry VIII. He does not profess to offer new material, but only to take that which all other writers have used and marshal it in such array that it shall tell its story as he thinks it ought to be told. So far as he betrays an attitude toward his subject, it is that of unlimited devotion to the principle of authority as against individual liberty. His particular antipathy seems to be directed against the use of the Bible as a source of religious certainty to the individual soul. Even his style, generally dignified and objective, becomes contemptuous and ironical whenever he approaches this side of his subject. Illustrations might be taken at random—"with the English Bible, or with the clear elocutionists who read it aloud in St. Paul's and other churches, to the disturbance generally of the peaceful, religious atmosphere of a place that was meant for devotion." It is apparently an offence to our author that the Bible should be read so that it can be understood, and such reading appears to him a disturbance of devotion! One can forgive this emasculation of all sense from religious service by so many English clergymen, but to find it formulated as a principle by an historical scholar of high repute would be a shock, if one were not accustomed to the atmosphere of Anglican controversy. Mr. Gairdner takes especial satisfaction in using the phrase "New Learning" for something which seems to him equivalent to the literal interpretation of Scripture—as if the attempt to understand the Bible and put it into English intelligible to the people were in itself a form of heresy. Even the printing-press as a means of rapidly disseminating false opinions comes in for a mild insinuation of disapproval. We are asked to believe that the English people did not want the Bible in their hands, and yet we are told at length of the difficulties the bishops had in keeping Tyndale's translation out of England and of the measures necessary to prevent disturbances in churches from the multitudes who flocked to hear the Bible read

by men who could do it well. Cromwell's order to place a Bible in every parish church is explained solely by motives of policy and greed.

In his final summing up, the author admits that good comes out of evil, and that Royal supremacy in England is better than Papal supremacy, but he has no word of sympathy for all those processes of individual inquiry and study by which men from Wycliffe on were coming nearer and nearer to the goal of a true enlightenment in religious matters. For the individual victims of tyranny, he has feeling only as a fortunate human being for unfortunate ones He regards their fate as the natural consequence of their own folly in having opinions of their own and daring to defend them, as against that order and authority which is to him apparently the supreme good. His real sympathies are reserved for men like More and Fisher, who stood for an authority which seemed to them higher than that of the despot who destroyed them. For Henry VIII, he has only words of execration as a crafty and unscrupulous wretch, defiant of every force in England that could seem to limit or oppose his own, yet dignified by his defence of order in the midst of threatening anarchy. "The principle of an Established Church, however at variance with theories which pious minds are too easily led to entertain, is one which, when once laid down, can never be set aside" —a remarkable prophecy, when almost every Christian country except England has already set this principle aside. Again:

> The political principle of Establishment cannot possibly be annulled, and if we are to have a practical religion, and not a mere chaos of sectarian philosophies, we must face the fact plainly.

Here is the clue to the whole book. It hardly need be added that the real problem of the spiritual origins of the English Reformation are as far from solution as before. Its solution cannot be even attempted, except by some one who can approach it without any of those partisan antagonisms which vitiate most of the writings of English churchmen about the English Church.

William the Conqueror, and the Rule of the Normans. By Frank Merry Stenton [Heroes of the Nations Series]. Pp. xi+518. New York: G. P. Putnam's Sons. $1.35 net.

No period of English mediæval history has recently been subjected to a more thorough scrutiny by the specialists than that of the Anglo-Norman kings. Since the first appearance of Stubbs's epoch-making work more than thirty years ago, an enormous amount of fresh material has been discovered (principally in Norman archives), and many old verdicts have been revised. Especially is this the case with the institutional side of the field. The details of Norman feudalism, the intricate problems surrounding the origin of the jury, the precise meaning and significance of the famous ordinance separating the temporal and spiritual courts, are far better understood to-day than ever before; and though it would be going too far to intimate that any of these questions have reached final solution, yet so much progress has been recently made as thoroughly to justify the appearance of a single volume on the greatest of the Norman kings which should summarize and present in convenient and popular form the results of the latest research in this interesting reign.

Mr. Stenton's book fills precisely this gap. It is a sane, accurate, and for the most part readable account of the life and work of William the Conqueror, which, while avoiding the pitfall of polemics, yet incorporates the results of the most important recent investigation of French and English scholars, of whom the most prominent is unquestionably J. H. Round. It worthily maintains the high reputation of the series to which it belongs for good printing, ample illustrations, and abundant tables, maps, and an index. It is not brilliantly written, and several rare opportunities to describe the memorable scenes of a most dramatic reign have been palpably neglected. Much more might have been made, for instance, of the grewsome story of Waltheof's execution and unfinished *Pater Noster* without doing violence to historical accuracy; and a little inkling of the rude jests and vigorous oaths that passed between William and Philip and led up to the firing of Mantes and the death of the Conqueror, would have done more to make the picture vivid than any number of stock phrases about William's "great strength" and "characteristic impetuosity." For absorbing narrative and dramatic interest, Sir J. H. Ramsay's Foundations of England" (1898) contains unquestionably the best account of the reign, but for the student who desires a short cut to the latest developments of the thorny constitutional and ecclesiastical problems of the period, Mr. Stenton's book will prove an invaluable guide.

From such a wealth of material it is difficult to select topics for special discussion. The last three chapters, on "The Church," "Administration," and "Domesday," form the most useful part of the work. Particularly valuable is the clear and discriminating account of the oath on Salisbury Plain in 1086. Mr. Stenton plainly shows that far too much emphasis has been laid on this event as a landmark in the development of English feudalism:

> Significant as is this clear enunciation of the principle that the King's claim to fealty overrides the lord's claim to service, it should not be taken to imply any revolutionary change in the current doctrines of feudal law. It is highly probable that this general oath was demanded with the single purpose of providing against the defection of disloyal knights to Cnut of Denmark in the imminent event of his landing. . . . But apart from this any feudal monarch could have maintained in theory that the facts of subinfeudation should not invalidate his sovereign rights; the question was merely as to the possibility of enforcing the latter. The exceptional power enjoyed by William and his successors in this respect was due to the intimate relations established between the King and his feudatories by the circumstances of the conquest; the oath of Salisbury was a striking incident and little more.

The final chapter on Domesday, though possibly a little too technical, is also sane and thorough, and its value is much enhanced by a number of well-selected quotations from contemporary or nearly contemporary chronicles and sources. The last of these, from the "Dialogus de Scaccario" in Henry II, gives the following significant explanation of the name by which the great survey has always been popularly known:

> This book is called by the natives "Domesdei," that is, by a metaphor, the day of judgment, for as the sentence of that strict and terrible last scrutiny may by no craft be evaded, so when a dispute arises concerning those matters which are written in this book, it is consulted, and its sentence may not be impugned nor refused with safety.

CURRENT FICTION.

Thais. By Anatole France; translated by Robert B. Douglas. New York: John Lane Co.

Mr. Douglas's excellent translation introduces to English readers with comparatively slight impairment of the virtues of the original work, a romance written in a field over which Anatole France has unique command. No other writer has realized so completely—so *deliciously*, as a follower of Renan might say—certain literary possibilities in ecclesiastical history and the legends of saints and martyrs. With one or two exceptions, romances in English concerned with the lives of the early Christians are to any but juvenile readers extremely insipid. Most of them are also one-sided; it must be confessed that an ulterior religious purpose does not seem entirely favorable to the art of fiction. Cardinal Newman, for example, wrote his pallid and long-forgotten romances in a religious ascetic's horror of paganism and with an eye to furthering the cause of Rome. Kingsley, of course with a vastly more virile art, wrote with a keen detestation of asceticism and a special pleasure in barking at Newman. But Anatole France, perhaps knowing in his own way as much about saints

as Newman, and certainly as much about sinners as Kingsley, aspires to write as a "philosophic angel" hovering a little above the earth, participator in nothing, spectator of everything. The belief of Jew absorbs him no more or less than the unbelief of Gentile; both he values for what they offer to the spirit that is strange or beautiful or intense.

The career of Thais, a fair Alexandrian courtesan of the fourth century, offered unusual attractions to the feasting eye of the philosophic angel. (For the history of the Thais story see G. D. Kellogg's letter to the *Nation*, February 25.) It is difficult to say whether he enters with more penetrating and illuminating interest into the life of the Alexandrian beauty and her favorites set in the dazzling luxury of the wicked city, or into the gaunt soul of the stylite Paphnutius ringed by the tombs and the desert. From both he preserves a complete emotional detachment. But in the dénouement the mask slips a little from the observant angel, and reveals something of the lurking cynic. For it is there made perfectly clear that Thais turned to heaven merely from satiety of the flesh, and Paphnutius to hell merely from satiety of the spirit —a conclusion sufficiently devoid of edification. Yet for piquancy of attack, for insight into the psychology of the anchorite, and for sheer brilliancy of narrative art, there is nothing like this in English.

The Lady of the Dynamos. By Adele Marie Shaw and Carmelita Beckwith. New York: Henry Holt & Co.

A captivating maiden opportunely dwelling in the jungle, a gallant young imported engineer, native customs as a foil for Anglo-Saxon habits—these are almost as staple a product in fiction-stuff to-day as ever were the governess and the earl or the fine lady and the irresistible tyrant. Novels move to and fro like the stock market. There is an ebb in industrials, be it thankfully said, and a decided drop in uncrowned royalties and throne-makers. Meantime, love among the lianas and engineering supervised by monkeys are in the ascendant. Before their luxuriance shall grow noisome—*experientia docet* —it is easy to enjoy the picturesqueness of tropical scenery invaded by the white man bearing thither his burden of electricity and telephone.

Landon West was sent by an American capitalist to Ceylon to make a pergolated fairyland, as realization, for the old money-maker, of early dreams prompted by impossible pictures in his geography. Happily for the purposes of a plot, the assistant whom West took with him proved to be a jealous trickster. Happily, too, the fortune-hunting woman who refused West before he sailed from New York felt that she had strong enough lien on him to follow him later to the jungle. Here, meantime, the true and only English girl had been not only helping Landon by her intimate knowledge of the lay of the land and of native superstitions, but had been doing deadly work with his healed affections. The situation speaks out loud and clear for itself.

There are other characters to carry on the drama, many of them drawn with marked cleverness. There are friends and opponents, natives outraged by careless treatment, rival land interests, dishonest plotters. Add to these birds and butterflies and an interesting list of more than biped actors—friendly elephants, furry wanderoos, tame ant-eaters—loved of the girl and, like the brown people, interpreted by her sympathetic understanding. West is a hero after the heart of young womankind—strong, resourceful, chivalrous. The whole matter is spun and woven with quite a masterly touch; with an evident knowledge of landscape and folk wild and tame; and with a swift, epigrammatic manner that swings the story along at a truly modern pace. It takes high rank among stories of its genus; its species is made quite its own by many traits of cleverness and wit, and of genuine feeling for beauty of the worlds without and within.

The Royal End. By Henry Harland. New York: Dodd, Mead & Co.

The title of this book is strangely significant as we realize that the dark Ferrash struck the tent of the Sultan of this pleasant little fancy-land of beautiful women and epigrammatic men before the story was done. Those who have enjoyed Mr. Harland's unstrenuous reclinings beside calm waters of allusive conversation will feel in no mood for criticism of his last work. Slight it may be, like his others; but one cannot help nowadays feeling a tenderness for the author who contents himself with telling a tale not too importunate, in the wholesome air and sunshine: it seems one must needs be shallow at times, if only to take breath to grapple once more with the unsavory problems of the underworld. The hero of this story is an Englishman, "the paragon of wit and chivalry," as gently whimsical as Adrian of "The Lady Paramount," and more comely to look upon; in short, a being well worthy of the patient devotion secretly cherished for him by the American heiress through 336 pages, and revealed only when it becomes necessary to end the story. She is wooed by a crown prince who offers her morganatic marriage, which she rejects with scorn; and when he at last offers her the crown itself, she prefers to find for her sentimental journey the Royal End of love on the honest if undemonstrative heart of Pontycroft. The descriptions of Italian scenery are of Mr. Harland's usual graphic graciousness; and one can but feel that in this last book his own peculiar vein of delicate irresponsible charm has fitly passed in music out of sight.

Fame's Pathway. By H. C. Chatfield-Taylor. New York: Duffield & Co.

This is apparently an attempt to "novelize" the first part of Mr. Chatfield-Taylor's Life of Molière. No doubt numbers of people will take it up who could not have been induced to open the biography, and if the object were to get information into them somehow as to certain events in Molière's early life, it would probably be attained. But the author's chief aim was obviously to present Molière in the flesh, and it must be recorded that he has merely succeeded in exhibiting a rather awkwardly stuffed effigy of him. The period chosen —that between his first impulse toward the stage and his discovery that his true vocation lay in the direction of comedy —is rich enough in material; but the biographer has been able to do very little for the novelist. Everything, of course, connects itself in one way or another with the beautiful Madeleine Béjart: it is she who first attracts Molière to the life of an actor, she who aids him in the luckless enterprise of the Théâtre Illustre, and she who urges and accompanies him toward his true calling and success. Unfortunately, she is represented by the story-teller as an assembly of virtues and accomplishments rather than a human being. But one could hardly hope to perform a feat of interpretation by means of so artificial a medium as Mr. Chatfield-Taylor here chooses to employ. He writes in the high-flown patchwork style which has become the recognized utensil of the historical romancer: "Angrily she turned on her lord: 'Thanks to thy footless intrigues, I was imprisoned with thee at Vincennes as thy accomplice. This present affair is mine own. I need no accomplices, and I promise a more profitable outcome' "—all upon the high-horse, and only a rocking-horse after all.

The Mystical Element in Religion as Studied in Saint Catherine of Genoa and Her Friends. By Baron Friedrich von Hügel. New York: E. P. Dutton & Co. $6 net.

These large, closely-printed volumes constitute a fresh store-house of fact and theory, of literary statement and critical discussion in the field of religious mysticism. To most readers, the portion of the work of chief interest will doubtless be the detailed biographical study of St. Catherine and her friends. Foremost among these friends were Ettore Vernazza and his daughter Battista, both of whom share sympa-

thetically Catherine's religious views. The period to which she belongs, the post-mediæval but pre-Protestant days, when the renaissance had already long been quickening the life of the Italian cities, has strongly attracted the author. As a loyal, but liberal son of the Roman Church, he has turned to it for some of the fairest examples of a genuinely spiritual Catholicism.

Such a biography is a contribution to religious psychology. Its value for this purpose is enhanced by an account, as full as the historical sources make possible, of the accompanying psychophysical conditions. The type of mysticism developed by Catherine follows in its main features the familiar teaching of Dionysius the Areopagite. This writer, purporting to be the convert of St. Paul, but in reality writing about the beginning of the sixth century, and hence commonly known as the pseudo-Dionysius, gave to the world a Christianized version of Neo-Platonism. This work, translated by Erigena in the ninth century, was the channel through which Alexandrian mysticism discharged itself into the life of the Church. Fundamental to this Christian mysticism was the view that God transcends the human reason so that he cannot be adequately known by processes of thought. It insisted, however, that a true illumination might be received directly by each soul in its inner experience. The result of these positions was that a somewhat lessened emphasis was placed by its followers upon religious dogma and ecclesiastical agency. Popular thought tends to associate with mysticism certain quasi-miraculous or spiritistic phenomena. Unfortunately, too, Professor Münsterberg has given countenance to this use of the term in his "Psychology and Life." In these vulgar aspects of mysticism Baron von Hügel displays no interest. He values mysticism only as he deems it an essential element in a healthful and sustained religious experience. It is significant also that he denies to mysticism any distinct faculty for the apprehension of reality.

Catherine, it is clear, possessed a vigorous intellect as well as a devout spirit. Her statements of religious thought rise quite above the level of conventional phraseology. Her sense of finitude and limitation, her feeling, shared by all the great mystics, that the soul is alien to the earthly life, finds expression in the saying, "I can no longer manage to live on in this life, because I feel as though I were in it like a cork under water." This is a picturesque change from the metaphor of the "fish out of water," a figure of speech appearing in the Upanishads, in the utterances of the ecstatic nun St. Theresa, and in those of Kierkegaard, the Danish reflective mystic of the nineteenth century.

The soundness of the author's view must depend ultimately upon the worth of the mystic experience and habit of mind. The *crux* of the matter is a question of values. What worthy end was served by Catherine's intense preoccupation with the imagined realities of heaven, hell, and purgatory? Was not the pathological and *maladif* element in her experience directly fostered by her other worldly interests? And was there not possible for her a more normal and at the same time a more fruitful spiritual experience? It is, of course, idle to quarrel with historical conditions or to demand that Catherine should wholly transcend her age. She could walk only by the light she had. No spiritual guide was at hand to point out other paths. But it seems possible that a soul of like intense and sensitive organization should be trained to an even larger usefulness without carrying the burden of other worlds than this. For there is an ideal of a genuinely spiritual life realized in each fleeting moment of time. Such a life would transmute all our human powers into earthly forms of truth, beauty, and love. It might even attain the highest spirituality without "taking thought of the morrow" that shall follow our earthly existence. Surely no fact or experience is made spiritual by projecting it into the future. Whether it is spiritual or not must depend upon its own intrinsic nature, not upon accidents of space or time.

Doubtless the author of these volumes has stated an important principle in insisting upon the value of a degree of detachment from the concrete business of daily life. For some natures, such detachment is an imperative need, both mental and physical. Few are strong enough always to abide in the dust and heat. Most need at times to exchange activity for repose, struggle for contemplation.

But it is an easy passage for religious natures from detachment from the particular to a sense of the presence of the universal with its all-enfolding power. When this power is interpreted in specifically religious terms and colored by strong emotion, the moments of detachment readily become the occasion of the mystic experience, more or less intense. The form of the experience may vary from the more active ecstacy of the Occidental type to the "immortal calm" of the Oriental. Such states are intensified by repetition; the objectified meanings, long accepted, become to the subject the surest, the clearest, and most significant of all personal convictions. There is thus a natural history of mystic states which may well give us pause when we are tempted to assign to them objective validity.

But however one may differ from the author, or however firmly one may be convinced of the subjective and illusory character of his theological presuppositions, it would be nothing less than provincialism to fail to recognize certain high qualities displayed in the work. It maintains throughout a spirit that is serious, candid, and hospitable to science, a spirit happily far removed from the orthodox jingoism of Mr. Chesterton.

The Oxyrhynchus Papyri. Part VI. Edited by Bernard P. Grenfell and Arthur S. Hunt. London: The Egypt Exploration Fund.

The product of the excavations for papyri conducted at Oxyrhynchus by Messrs. Grenfell and Hunt for the Græco-Roman Branch of the Egypt Exploration Fund continues to furnish material for publication, though the excavations have been brought to a close. Volume VI lies before us, and Volume VII is promised within a few months. The latter will contain a detailed account of the site and of the excavations conducted upon it, with a review of the topographical knowledge derived from the papyri there discovered.

The two most important of the literary papyri published in Volume VI are from the remains of the large find of such materials made January 13, 1906. The non-literary documents are chiefly from the campaign of 1897. Preëminent among the new classical texts are the fragments of the "Hypsipyle" of Euripides. These "constitute the most important addition to the remains of Greek tragedy hitherto made by Egyptian papyri." The identification is indubitable—style, contents, and coincidence of text with citations by ancient authorities all agreeing to put the question beyond doubt. As is the case with so many papyri from the rubbish heaps, the fragments, more than two hundred in number, are almost all of small size. One only, presenting an early part of the play, is complete enough to furnish good reading for those who have no taste for this form of dissected puzzles. But even they might well be interested to see the ingenuity with which the scattered fragments have been pieced together so as to yield up in great measure their secret of the Euripidean plot. The story of Hypsipyle is told by several ancient authorities, but the tale according to Euripides appears to introduce some new variants, especially in connecting two sons of the heroine by Jason with their mother's adventures in Nemea. An interesting side-point for the student of "sources" in Latin literature is the indication that Statius, who in his "Thebais" has been generally supposed to have followed this lost play of Euripides for his account of Hypsipyle at Nemea, must have followed instead some other authority.

The writing of these fragments is not of very early date, belonging to the end of the second century after Christ, or the beginning of the third. The next longest of the literary documents is of about the same date as the Hypsipyle papyrus, but is of little interest to general readers. It contains considerable portions of a somewhat controversial commentary on the second book of Thucydides by an unknown author who wrote in the early years of the Christian era.

Among the few fragments of extant classical authors a page of Sallust's "Catiline," of the fifth century, deserves mention rather because of the rarity of Latin classics among the Egyptian papyri, than because it furnishes new readings, though it does tend to substantiate one that has been hitherto but weakly supported.

The non-classical documents comprise the usual miscellany of official and personal writing, among which the special student of Egyptian administration will turn to the former class, while the less strenuous reader will find some human interest in the latter. None of the private letters are of as picturesque a character as some of those in previous volumes, but their commonplace mixing of business and personalities gives them a certain realistic attraction. Among the official documents students of Roman antiquities will need to note a Latin declaration of birth (No. 894) made before the Prefect of Egypt at Alexandria, 194-196 A. D. This does not agree with the regulation of Marcus Aurelius, that records of births of Roman citizens in the provinces must be returned at the offices of the *tabularii publici*. Professor Mitteis suggests that by *tabularii publici*, "the præfectorial bureau is meant." But it might be more reasonable to suppose, without raising other objections to that interpretation, that, as Egypt was a personal domain of the Emperor, the regulation mentioned concerning the regular provinces did not apply there. The fragment is palæographically interesting on account of the scarcity of dated specimens of Roman cursive writing.

The volume is concluded with the customary full and varied indexes, followed by six excellent plates of facsimiles.

Among the Wild Tribes of the Afghan Frontier: A Record of Sixteen Years' Close Intercourse with the Natives of the Indian Marches. By T. L. Pennell, M.D.; with an introduction by Field-Marshal Earl Roberts, and 37 illustrations and 2 maps. Pp. xvi+324. Philadelphia: J. B. Lippincott Co. $3.50 net.

This is the record of a singularly interesting and humanizing work among a remarkable people. They live in the narrow strip of mountainous borderland which separates India from Afghanistan, but are subject neither to the viceroy nor the amir. The only control exercised over them is the prevention both of the raids which for ages they have made into the Indian valleys at harvest-time, and of their robbery of the caravans in the Himalayan passes. They are being reached, however, by means of hospitals established by the English Church Missionary Society along the frontier, where all patients are treated free of charge. To these institutions come great numbers of the men, women, and children of these wild tribes; and it is the experiences of a doctor who for sixteen years cared for them which are given in this volume. The proceeds of the sales, we may add, will be devoted to the building of another hospital. In this book, as Earl Roberts says in his introduction, Dr. Pennell "throws many new and interesting sidelights on the domestic and social, as well as on the moral and religious, aspects of their lives and characters." These present a strange medley of contradictory qualities, courage blended with stealth, touching fidelity—they make the best soldiers in the native Indian army—with the basest treachery, and high conceptions of honor vindicated by the foulest murders. Dr. Pennell was once the guest of a villager, and his host showed him "holes in his door and in the wooden panels of the windows which the bullets of his neighbors across the street had penetrated, and said: 'It was behind that hole in the door there that my uncle was shot; that hole in the window was made by the bullet which killed my brother.' Pointing to another Afghan who had come into the room and seated himself on the bed, he said: 'That is the man who shot my brother.' On my remarking upon the peace and good-will in which they appeared to be living at the present time, he said: 'Yes, we are good friends now, because the debt is even on both sides. I have killed the same number in his family.'"

Dr. Pennell's work was not wholly medical or confined to the tribesmen, as is shown by his account of an interesting episode in his toilsome life, in which teaching boys was an important part. In 1906 he took the football team of the Mission High School at Bannu on a tour through a great part of northern India. He also made a tour as a Christian mendicant, during which he came into close contact with Eastern ascetics, of whom he gives a most interesting and instructive account. His whole book is, in fact, characterized by the comparatively new idea that missionary work should no longer be destructive, but constructive. He recognizes the good that there is in the belief in the unity of God and the folly of idolatry of the Mussulman, and the vital truths contained in the Hindu philosophies, the source, to use his own words, of "the religious spirit, the ardent faith, the unquestioning devotion, which have been the crown and glory of India for ages." The closing chapters are upon the value of missionary work, especially the medical part—the outpost, as it were—and many encouraging facts are given in the lives of Afghan patients in the hospital or boys in the mission school, which show that the practical Christianity taught by kindly deeds is reaching and gradually transforming not only the frontier tribesman, but also the Central Asian. Numerous illustrations and two maps add to the attractiveness of an enlightening work which we can confidently recommend to all students of the problems which India presents, not to the English only, but to the whole civilized world.

The Political and Economic Organization of Modern Japan. By Gregory Wilenkin; translated from the Russian by E. J. Harrison, editor of the Japan *Advertiser*. Tokio: Kondo Shoten.

The busy man desirous of information, otherwise to be had only by an extended survey of various volumes and unapproachable official documents, on the political and financial organization as well as the actual resources, of the Japanese Empire, will find in this new volume a handy compendium. The English translation is excellent. The early chapters on the origin of the Japanese, the condition of the country before the Restoration, and the abolition of the feudal system, comprise a brief résumé of much that has been already said by other writers; the chapters that immediately follow, dealing with national politics and the promulgation of the Constitution, fairly estimate the forces that have gone to the making of modern Japan. The chapter on the rise and progress of political parties is specially interesting, though one might question the author's judgment in various details.

In treating of the economic organization of Japan the author approaches a subject in which he is apparently more at home than he could be expected to be in exploring the formative motives of Japanese politics. The chapters on the history of currency circulation and the banking system are valuable contributions. A detailed account of the revenues includes an interesting discussion of the various taxes, their incidence, and the amounts derived from them over a period of years. Monopolies, railway nationalization, customs duties, foreign trade, with comparative tables of imports and exports, shipping, agriculture, mining, marine, and general industry, and the national wealth are all duly considered.

As to Japan's military exploits and

expansion of armaments, M. Wlenkin says:

It is only fair to note that in Japan itself the policy of increased armaments is beginning to encounter powerful opponents; voices are loudly proclaiming that with the conclusion of the Anglo-Japanese Alliance and the establishment of friendly *ententes* with France and Russia, no foreign danger threatens Japan, and that she must therefore abstain from any further expansion of armaments, the more so seeing the means therefor are not in sight. During 1908-9 the government can probably carry out the contemplated programme without a large deficit, thanks to the balance from the War Fund and the payment for the maintenance of the Russian prisoners, but after 1909 these sources will no longer exist. . . . Existing taxes are already so high that further raising of them would be an intolerable burden on the people.

The author concludes with the following statement, to which none more readily than the Japanese themselves will subscribe:

If Japan wishes to retain the position which she occupies among foreign Powers, she must direct all her energies to the development of the economic forces of the country, to the expansion of her trade and industry, and, above all, confine herself to a normal budget commensurate with the ordinary revenues of the country.

Science.

Memories of My Life. By Francis Galton. New York: E. P. Dutton & Co.

Mr. Galton is one of the inner circle of men who, for the past fifty years, have helped to direct the course of scientific investigation in the British Isles. A cousin of Charles Darwin, and connected through marriage with the higher ranks of English *intellectuels*, he has come into intimate contact with all that is best in English officialdom. Besides this, he has made important contributions to many branches of science. He began his career by a remarkable journey into the neighborhood of Walfisch Bay, South Africa, and wrote one of the most interesting accounts of savage life in the English language. He was among the pioneers in the more accurate study of meteorological phenomena; to him the idea and name of "anti-cyclone" is due. There are those who think that his additions to the doctrine of evolution are as likely to stand the test of time as those of his better known and more illustrious cousin. Though not a mathematician himself, he has paved the way for a quantitative and exact treatment of the problems of heredity and has practically been the founder of the branch of study known as biometrics. In psychology, he has initiated many novel lines of investigation and has helped to make anthropometry an established branch of anthropology. He is, perhaps, best known to the public for his suggestion of finger prints as the simplest and most accurate means of personal identification, a method now used in all the rogues' galleries of Europe and America.

A life filled with such variety of interests is well worth chronicling, and to some extent this volume sums up modestly, but clearly, his scientific labors, and some of his entertaining experiences. But the attempt to combine an account of his scientific achievements with the more personal aspects of his career has prevented this book from doing justice to either. In his own books, he is the most lucid of writers, but here he often fails from lack of space to make evident the significance and novelty of his researches. Regarding the many notable persons with whom he has been on terms of friendly intimacy, he has little to say that is illuminating. Natural reticence has, except in a few instances, stayed his hand. Only occasionally we come across an anecdote, like that about Herbert Spencer (p. 258):

Spencer, during a pause in conversation at dinner at the Athenæum, said, "You would little think it, but I once wrote a tragedy."

Huxley answered promptly, "I know the catastrophe."

Spencer declared it was impossible, for he had never spoken about it before then.

Huxley insisted.

Spencer asked what it was.

Huxley replied, "A beautiful theory killed by a nasty, ugly fact."

Yet the book throws much light, though somewhat dry, on a remarkable figure. Like Herbert Spencer in his curious Autobiography, Mr. Galton treats his own character and development as a subject for scientific inquiry, with some significant results. As is natural with such an authority on heredity, he is much concerned in his first chapter to elucidate family traits. His power of enduring fatigue, shown in his travels and otherwise, he traces back to the Barclay blood, the most distinguished representative of which, Capt. Barclay, was renowned among English sportsmen as the first man to walk one thousand miles in a continuous thousand hours. His tendency to asthma comes from the Galtons; and, though he does not draw attention to the fact, his scientific proclivities are obviously derived from his grandfather, Erasmus Darwin, who, many think, was the most original of the Darwin family. From him probably came Mr. Galton's power of contriving ingenious apparatus for investigating obscure phenomena—a power best exemplified in his well-known method of composite portraiture, but also shown in numerous instruments of precision. Many of these are enumerated in the 183 books and memoirs, a bibliography of which is given as an appendix of the volume.

Perhaps the predominant feature of Mr. Galton's mind is exhibited in his persistent attempts to obtain quantitative precision in all the problems he has dealt with; and this tendency can undoubtedly be traced to his training at Cambridge, though during his university years he was nominally studying medicine. His use of the Gaussian law of probability in his investigations into hereditary genius is the most striking example of this tendency. Like Stanley Jevons, he has a mathematical mind without a mathematician's equipment. Thus he has been able to set professed mathematicians to work on lines of great promise and has founded a whole school of biometric inquirers, headed by Prof. Karl Pierson. Of recent years Mr. Galton has made himself most widely known by a practical application of his views on heredity, to which he has given the name eugenics. He believes that the race of men can be almost indefinitely improved by careful selection in mating, so that the laws of hereditary genius shall have the fullest scope. On the other hand, a movement towards restriction of the mating of the unfit has already shown itself in legislation and in public opinion.

A career of such significance deserves an even more adequate account than that given in these pages.

In the well-printed and well-illustrated little volume entitled "The Scientific Aspects of Luther Burbank's Work," by President Jordan and Professor Kellogg of Stanford University (San Francisco: A. M. Robertson), one naturally looks for the most recent facts bearing upon the achievements of Mr. Burbank. It is therefore a surprise to learn from the introductory notice, page xiv that the two communications here given are reprints of magazine articles first published in the *Popular Science Monthly* in January, 1905, and October, 1906. Mr. Burbank's scientific reputation has suffered a good deal at the hands of writers who, in his catalogues and his ways of doing things on a large scale, have found excellent material for sensational "copy," and it is much to be deplored that his good friends, when they have a chance, do not set him right before the public. It is barely possible that neither President Jordan nor Professor Kellogg revised this reprinted matter, else they would not have allowed such a statement as this to see the light under the date of 1909: "Sugar-cane seed is needed." The proof-reader, at least, was not aware of the recent successful experiments in the tropics, from Java to our West Indies, which have placed sugar-cane seed within the easy reach of the progressive planter, and established seedlings with constantly increasing sugar-content in a great number of the enterprising plantations. Both of these authors are capable of giving the public, lay and professional, a fair statement of Luther Burbank's best work, which shall be up with the times, and creditable to all concerned. This little republication leaves much to be desired.

The principal lesson of the Colorado Canyon, according to Prof. W. M. Davis, in a lecture before the Royal Geographical Society, summarized in the *Geographical Journal* for May, is that it is the work of normal erosion, not a sudden huge fracture; and it may be reasonably described as a young valley. He believes that, if the erosion continues, the plateau will in time be reduced to lowlands by the energetic river. In introducing the speaker the president, Major Leonard Darwin, said that he thought

Professor Davis has done more than any man on either side of the water to raise the standard of the teaching of geography in the direction of making it a more definite science.

This number contains also an article by Professor Oberhummer of Vienna, showing how much geography owed to the artists of the renaissance, especially Leonardo da Vinci and Albrecht Dürer. It is illustrated by nine of their maps, of which the artistic embellishments are remarkable.

Prof. James Major Colson, for the last five years principal of the Dinwiddie Agricultural and Industrial Institute, died May 22, at the age of fifty-five. After graduating at Dartmouth College, he received an appointment in the United States Internal Revenue office in Petersburg, Va. Shortly after this appointment he was elected teacher in the Virginia Normal and Collegiate Institute, now the Virginia Normal and Industrial Institute. There he held the chair of natural science for twenty-one years.

Drama and Music.

"The Last of the De Mullins," the comedy by St. John Hankin, which was produced by the London Stage Society some time ago, has now been published by A. C. Fifield of London. Like other pieces by the same author it is not lacking in whimsical humor or satirical point, but it is not the equal in general literary or dramatic quality of "The Return of the Prodigal," "The Charity That Began at Home," or "The Cassilis Engagement." In the main it is a plea, if not exactly for free love, at all events for the free right of motherhood, without any preliminary or subsequent matrimonial contract, on the broad ground that the way of nature is older than social or religious regulations. Mr. Hankin, of course, has invented conditions to suit his theories. He has imagined a young woman, of high, independent spirit, who revolts against the hollow pretence and artificial restrictions of the life imposed upon her by her father—a faded remnant of the old feudal system—surrenders herself to a boyish lover, and makes her way to London, where she supports herself and her child, and, with the aid of a convenient legacy—the *deus ex machina* in this instance—starts a hat shop and maintains herself in wealth and respectability. So impregnable is her position that she rejects with scorn later suggestions of marriage with her lover, refusing to interfere between him and the bride of his riper choice. This brilliant and hardy heroine, the mouthpiece of Mr. Hankin's philosophy, pours easy ridicule upon the conventions which she has so successfully disregarded, but carefully avoids all reference to the economic consequences which would follow upon a general adoption of her principles. An adept in the use of specious or superficial argument, she is conspicuously deficient in the common sense of which she is supposed to be a shining example. Wholly apart from any question of morals the play is as mischievous as it is foolish in its advocacy of a sexual liberty which would be speedily subversive of all social order. In its satire it is both amusing and effective, but its characterization, except in the case of the heroine, is stale, and its dramatic quality insignificant. It is, indeed, rather a thesis than a play.

"The Prisoner of the Bastile," a new version by Norman Forbes of Dumas's "The Man in the Iron ask," which is said to have made a hit at the London Lyceum, is a wild, romantic melodrama, in which historical fact seems to have been treated with rather more contempt than usual. The hero is supposed to be the elder twin brother of Louis XIV, and prisoner and usurper are both in love with Louise de la Vallière. The leading parts are doubled by Matheson Lang.

"Vera" is the name of a play written for Fannie Ward, by Lee Arthur and Forest Halsey. It is supposed to be illustrative of the "unwritten law" of which too much has been heard lately. The scene is laid in America, and the heroine kills the man who has failed to redeem his promise of marriage. Charles Cartwright is to play the part of a faithful old servant of the homicidal lady. The piece will be seen first in London.

Henry Russell, of the new Boston opera house, is the latest manager to defy the big singers. He will, to be sure, open his house with Nordica and Constantino, but, after that the ensemble, not the star, is to be relied on. He may succeed if it is true, as reported, that with the building not yet completed, no new operas promised, no stars featured, already every one of the fifty-eight subscription boxes and every one of the subscription seats in the orchestra and balcony is taken for the three years required, with a long waiting list. While abroad, Mr. Russell intends to hunt for good singers in Russia, being convinced that that country has not been studied to its last possibility by the impresarios.

Norreys Connell, who had been acting as manager of the Abbey Theatre, Dublin, has accepted the post of director, in the place of the late J. M. Synge. A new one-act play by him, "Time," was recently performed. It is an allegorical fantasy, and might be described as a modern morality play. The scene is on a highroad leading to Rome, and there are three characters—an artist, a young girl, and Time. At the same theatre there was produced recently a new play by Lord Dunsany, "The Glittering Gate." The action takes place in Purgatory. The two characters, who were burglars during their earthly existence, succeed in opening the glittering gate, only to find, to their disappointment, a heaven full of stars.

The Theatre of Ireland Society recently produced two new plays in Dublin. One "The Shuiler's Child," by Seumas O'Kelly, is the story of a child deserted by its parents, and taken from the workhouse to nurse in a farmer's house. In the second piece, "The Gomeril," Rutherford Mayne has produced a humorous study of Ulster life, which owed much of its success to the clever acting of Miss Nora Fitzpatrick as the elderly spinster who was to have provided the Gomeril with a bride.

The opera season of 1908 and 1909 has been disastrous throughout Italy, owing to the lack of good singers. Theatre after theatre has been closed, after playing to half-empty houses. Strauss's new opera, "Elektra," was received at the Scala, Milan, with a mixture of applause and hissing on the first night, and at the second representation the house was not half filled. Such a failure following that at Berlin and Dresden may react on the popularity of "Salome."

Isaac Albeniz, the Spanish composer, died May 19 at the age of forty-seven. He was a pupil of Marmontel, Jadassohn, Reinecke, and Liszt. "The Magic Opal," a comic opera, was brought out in London in 1893. Among his other operas are "Enrico Clifford" and "Pepita Jiménez." He composed about two hundred pieces for the piano. He made his home in London for many years.

Art.

Mediæval Architecture: Its Origins and Development, with Lists of Monuments and Bibliographies. By Arthur Kingsley Porter. 2 vols.: I, The Origins; II, Normandy and the Ile de France. Pp. xviii+482, 499; 289 illustrations. New York: Baker & Taylor. $15.

The intellectual quality of mediæval European architecture, the strict logic of its evolution, and the poetic beauty of its masterpieces make it a peculiarly attractive study to laymen as well as to architects; but it is a singular fact that no one has yet produced a comprehensive history of the group of styles which we call Romanesque and Gothic. Some scores of writers in English, French, and German have treated particular phases of this architecture or, in brief handbooks, have epitomized certain aspects or divisions of its history and development, but the public is still waiting for a general history of Christian mediæval architecture by a competent hand. The two handsome volumes by Mr. Porter are apparently the beginning of a monumental series designed to fulfil this comprehensive programme. Otherwise the title is misleading. These volumes deal chiefly with French ecclesiastical architecture of the middle ages, although the preludes include an extended discussion of Greek and Roman architecture and a somewhat briefer survey of the basilican and Byzantine styles. The Italian, English, and German styles are considered mainly in their relations to the general movement which reached its highest development in France and French Gothic architecture, as if it were the only architecture worthy of extended study

since the middle of the twelfth century. The second volume, indeed, deals solely with the architecture of Normandy and the Ile de France.

The chief defects of this ambitious effort to cultivate exhaustively a restricted field, lie in the author's strong predilections and antipathies, the lack of balance in his judgments, and, it must be confessed, an apparent deficiency in technical training. Roman architecture and renaissance design arouse his fierce hostility; "depraved taste of modern times," "blatancy," "vulgarity," "dreary monotony" are the terms he constantly applies to them; while the Gothic forms are "ravishing," "entrancing," "lovely," and otherwise superlatively pure and excellent. This uncritical partisanship, with not infrequent slips in the discussion of the technicalities of vaulting and construction, seriously mar a work which, with judicious pruning and revision, would gain in value what it might lose in bulk.

Yet in spite of these serious defects, Mr. Porter's work possesses many notable merits. It is a monument of painstaking documentary research, and many of its sections are excellent reading. The style is rather loose, but readable and sometimes spirited. The presentation of the historical environment and of the less obvious forces at work in the production of the great architectural activity of the middle ages, especially in France, is often admirable. Statements of fact are generally accurate, and authorities are quoted on matters of controversy. The bibliographies at the end of each volume indicate wide acquaintance with the authorities, and a scholarly habit in classification and citation. They constitute an apparatus of great value to all future students of architecture. But they are less interesting and remarkable than the lists of monuments, with more or less extended historical and critical notices, which follow each chapter. Thus in the Lombard list, 92 separate buildings are noted, with specific comment on all but a half-dozen or less. In the Norman list 413 churches are mentioned, and in the Gothic (pre-flamboyant) list 392, nearly all in both lists with at least a line or two of comment or description, while some have a full page or more of text. Published in a volume apart, these bibliographies and lists would alone constitute an important work of reference. For this digest of a vast body of information otherwise only obtainable by digging through hundreds of volumes, many of them rare, students of architecture owe Mr. Porter a real debt, and will easily overlook the occasional display of recondite and unnecessary erudition.

The illustrations are numerous, and for the most part well chosen, with a fair sprinkling of plans; but there should have been many more sections than are shown, for the section gives the key to the structural design in Gothic architecture. The omission of scales from all the plans and of reference letters employed in the text from several of the diagrams, is also to be regretted. Indexes, tables of contents, and lists of illustrations are full. The printing is excellent.

The Plate Collector's Guide: Arranged from Cripps's "Old English Plate." By Percy Macquoid; with numerous illustrations and plate-marks. New York: Imported by Charles Scribner's Sons. $2.25 net.

The Old Royal Plate in the Tower of London, including the Old Silver Communion Service of the Chapel of St. Peter ad Vincula within the Tower. By E. Alfred Jones. Oxford: Fox, Jones & Co.

To two classes of American readers authoritative works on old English plate are especially valuable. Many well-to-do people in this country have collections of plate which they have bought with more or less discrimination. Practical silversmiths are doing sufficiently important work here to need the inspiration of examples of the best of other times and countries, and, failing originals or such electroplated reproductions as have been provided in some museums, good illustrations have great value. Both collectors and craftsmen will find Mr. Macquoid's abridgment a satisfactory and inexpensive substitute for Cripps's monumental work, which, since its first appearance in 1878, has gone through many editions. Some parenthetical additions have been included to embody the results of late research. The omissions appear in the main to have been judiciously made, though the entire exclusion of the chapter dealing with ecclesiastical plate must somewhat impair the value of the book in this country, where the making of articles for ecclesiastical use is among the most promising developments of American arts and crafts. Half-tone illustrations have been extensively used in place of the line drawings in "Old English Plate." Several photographs are from Winchester College plate which was practically unknown before 1903.

E. Alfred Jones's book is one of the sumptuous volumes dear to the English country house. It is no perfunctory performance. The author, who has also been responsible for the illustrated catalogues of the collections of plate owned by J. Pierpont Morgan and by Leopold de Rothschild and of the royal plate collections at Windsor Castle and at St. Petersburg, owes to the favor of King Edward VII his privilege of studying the treasures of the Tower which made the present book possible. These extraordinary facilities have been well utilized. Mr. Jones's concise, well-written text is devoted to simple statement of facts. He has no archæological thesis to maintain. He sets forth what is definitely known about a number of the most serious commissions ever entrusted to English metal workers, describing in detail such objects as the Coronation Anointing Spoon, made in the late twelfth or early thirteenth century, and by some lucky accident spared the crucible in which Charles I melted down royal heirlooms; the Charles II Font and Basin, employed in christening many members of the royal line; the beautiful silver gilt maces, made for sergeants-at-arms in the reigns of Charles II, James II, and William and Mary; and the communion vessels in the Chapel of St. Peter ad Vincula whose cypher the author believes to be that of Queen Charlotte. Mr. Jones's letterpress abounds in illuminating citations of original documents. The extreme floridity, for example, of the objects made for royalty in the first years after the Restoration is explained, of course, by the influx of Dutch artists whom Charles II encouraged to such an extent that in 1664 the London silversmiths petitioned him for protection from their competition. Among the biographical notices is an account of Francis Garthorne, who was employed by every monarch from Charles II to George I, and whose initials are found on a paton and communion vessels in Trinity Church, New York, on three vessels at Christ Church, Cambridge, and on a flagon at St. Paul's Church, Newburyport.

The Russian Archæological Institute has issued a report of the investigations under its care at Salonica during the years 1907 and 1908. The quantity and value of the remains discovered in the three churches of St. Demetrios, St. Sophia, and St. George give Salonica an importance second only to Ravenna as a treasury of Byzantine art. The researches made under the control of the Institute by its director, Mr. Upensky, were chiefly devoted to the Church of St. Demetrios. The mosaics were overlaid with whitewash at the time of the Turkish Conquest. The Imperial government recently decided to carry out some repairs, which resulted in the temporary uncovering of the mosaics. When Mr. Upensky had the opportunity to make his investigations the workmen had already recovered part of the mosaics; but he was able to make detailed investigations in the nave, on the north transept, and in the lateral colonnades. St. Demetrios, the patron saint of Salonica, is the most prominent figure in the compositions, appearing about a dozen times in various postures In one case he is represented standing in a shell-shaped niche and wearing a white robe bordered with gold and decorated with a large band. Near by is a group of three persons: In the centre is St. Demetrios; on the right stands the Illyrian prefect Leontius, and on the left Bishop Eusebius. Ikons of the Virgin also appear in many places. These are of interest to students, for they re-

call the most ancient extant representations of the Holy Mother—such as, for instance, that in the Church of Kitti, near Larnaca in Cyprus. The Panaghia occurs in all groups commemorating miraculous cures achieved by St. Demetrios, although in the corresponding legends there is no mention of the Virgin's intervention. The backgrounds of the groups are landscapes, architectural details, and cultus-objects. On a series of medallions are representations of saints.

From the annals of Salonica we know that the Basilica of St. Demetrios was destroyed by fire in the seventh century. The mosaics now discovered would thus appear to belong largely to the time of rebuilding. But Mr. Upensky gives reasons for assigning many of the remains to an earlier period, which would indicate that the destruction of the church was only partial An inscription gives the date of the restoration as belonging to the period of Leo the Iconoclast, who reigned in the first half of the eighth century. The characteristic feature of the mosaics is their realism. The scenes are taken from actual life and are devoid of mystic or symbolical significance. The designs are clear and vigorous, and the faces, which are represented in full or three-quarter view, are full of character. As regards technique, blue is the prevailing color of the backgrounds; silver is always used for the nimbus; there is no nacre on the vestments. The mosaic is formed of tiny cubes, much smaller ones being used for the faces than for the rest of the composition.

The recent investigations made by Dr. Dörpfeld of the German Archæological Institute at Olympia have set beyond doubt the truth of the old legends which ascribed the importance of that city to a time before the Dorian invasion. Excavations around the Metroön and the Treasuries have brought to light remains of small dedicatory temples of prehistoric date. In a black sandy stratum were discovered sherds and other earthenware objects, which in their form and incised decoration show close affinity to the pottery found on neolithic sites.

Several notable prices were obtained at the sale of the Cuthbertson pictures at Christie's, May 21. Romney's portrait of Mrs. Blackburne went to Agnews for $26,000, his Mrs. Newbury was secured by the Bath Museum for $26,775. Jacques's The Flock was bought by a New York house for $16,000.

The Académie des Beaux-Arts, in the section of architecture, has elected Victor-Alexandre-Frédéric Laloux, in place of the late Alfred Normand. The new Academician built the railway stations at Tours and at the Quai d'Orsay.

Charles Green Bush, chief cartoonist of the New York *World*, died May 21 at the age of sixty-six. He was first an illustrator for Harper & Bros., and after a few years went to Paris, where he studied drawing at Rimmel's, and with Bonnat. He drew cartoons for the *Herald* and *Telegram* for several years, and in 1897 joined the staff of the *World*. Among his creations was "Father Knickerbocker."

The death is announced from Paris of M. Colomb, the caricaturist known in France as "Moloch." He had been a strong satirist of men in office and of politicians.

Finance.

A CHAPTER IN HIGH FINANCE.

The death of Henry H. Rogers has evoked the various comments always suggested by the death of a Wall Street magnate of enormous wealth; they had mostly to do with the financial effects of the event; for Wall Street regards its rich men less as men than as cogs in the wheels of a huge machine. There are, however, other considerations which arise in the thoughtful mind.

It is not as an organizer and manager of the Standard Oil Company that Mr. Rogers is likely to be chiefly remembered—another capitalist will personify that exploit in later history—but as one of the so-called "Standard Oil group" whose spectacular activities were in other fields. John D. Rockefeller, some years ago, went out of his way to declare, in a public interview, that the company was not concerned in Stock Exchange operations, that there was no "Standard Oil party" in the speculative market; and that the whole allegation was merely based on the fact that Standard Oil directors owned investments in other corporations. This was a somewhat specious declaration.

The actions of this particular group of capitalists, early in the financial "boom" which began with 1898, gave a wholly new conception of the functions of what had previously been known as "high finance." Borrowed from Europe's markets, this term had long referred to bodies of immensely wealthy capitalists who acted in concert, who dealt with governments when national debts had to be incurred, and who moved their fortunes into and out of given investments, usually of the highest character, according as circumstances of the day made the outlook favorable or unfavorable. High finance thus became the epitome of conservatism; it was popularly regarded with deep respect and with something of awe, for it was known to stand, not only for the soundest financial judgment, but for the most strictly honorable methods.

The "promotion period" from 1899 to 1901 in America turned men's heads; it was then that high finance in America began to acquire a very different reputation. The story really opened with the Amalgamated Copper flotation of 1899, which was carried out in a way as wide as the poles asunder from European high finance; the methods of unscrupulous and irresponsible mine promoters being sedulously followed. This was done distinctly under the names and auspices of the "Standard Oil group," and was something not far from a public scandal. Events moved swiftly after that. By 1901, an extraordinary situation had arisen. American high finance was divided into two bitterly hostile camps, of which the "Standard Oil group" was one. Both had engaged in sensational promotion schemes, some of which were of a highly questionable character; both were speculating heavily on the Stock Exchange. One of them seemed, at the climax of the April stock-jobbing mania of that year, to have lost all sense of restraint or proportion, apparently believing that aggregated capital could defy the laws of political economy and create a "new finance" in which the principles of preceding centuries would be abolished.

In this period of mental unsettlement, however, the "Standard Oil group" seemed to retain its senses. It avoided the extravagant promoting mania which afflicted the rest of Wall Street, and was possibly for that reason better equipped when it plunged headlong into the celebrated conflict with its rivals over possession of the Northern Pacific. It lost the fight, but it had not entangled itself in a score of other directions as the rival group had done, and in 1903 it had its reward, picking up at bargain prices the securities which the others flung over in their struggles with the "rich men's panic."

It was thought, at the time, that even if the old-time traditions of high finance were gone, this issue to the events of 1901 meant that Rogers and his colleagues of the "Standard Oil group" possessed enough of the ancient attributes of high finance to keep them at least from illusions and excesses. There was, however, no real ground for such inference; the senseless efforts of these capitalists to fix their own price for copper, through the Amalgamated concern, had shown that they too were subject to the illusions of the day; and the next few years proved that nothing whatever had been learned from the experience of 1903. When 1906 and 1907 arrived, the tables were turned, between the two rival groups of high finance, in a most dramatic way. Rogers and his associates lost their heads exactly as their rivals had done in 1901, tying themselves up in an ill-timed and ill-judged Stock Exchange speculation of enormous proportions, based on prodigious home and foreign borrowing, and on utterly reckless use of the surplus funds of the largest corporation which they controlled. Thus entangled, they were caught in the panic of 1907, with results which Wall Street was able dimly to follow, and which gave the last touch of absurdity to theories of the La Follette sort that these capitalists themselves brought on the panic, to serve their selfish purposes. While they were floundering in the stock and money markets, the rival group whose predicament they had used to so profitable a purpose in 1903 was engaged in picking up the similar bargains of 1907.

Altogether, it is a curious story in the annals not only of the Stock Exchange, but of that high finance, to the popular

idea of which it has given so new a shape. Yet it was typical of the period's financial history. "Thinking in hundred millions" for purposes of promotion and manipulation led naturally to the sequel of fortunes of fifty millions or more, embarked in turbulent Stock Exchange speculation, and subjected to losses in the tens of millions through exhausted margins.

Notable New Novels Just Ready

Walter P. Eaton, who made his reputation as dramatic critic of the "Sun" and author of "The American Stage of To-day," is co-author with Elise M. Underhill of The RUNAWAY PLACE.

The romance of the man out of a job and the mysterious maid from Somewhere who meet in Central Park ("The Runaway Place"), where for a while they are as children who had forgotten to grow up. There is something in it of Kenneth Graham's half wistful, half playful love of vanished childhood days. ($1.25.)

One of the publishers' readers wrote of Eva Lathbury's THE LONG GALLERY: "Work of a really high order . . . the characters are live, the situations intensely interesting and real . . . has somewhat the same charm that Kenneth Graham's stories have, tho from quite a different viewpoint; and has even a suggestion of Kipling's 'They' and 'The Brushwood Boy.'" ($1.50.)

The Boston "Transcript's" complete brilliant notice of Holder and Jordan's delightful Fish Stories, or circular of American Nature Series sent on application.

HENRY HOLT & CO., 34 W. 33d St. NEW YORK

"An exhaustive treatise which is bound to attract widespread attention."

The Negro Problem
Abraham Lincoln's Solution
By William P. Pickett

600 *pages*, 8vo. *With Photogravure Frontispiece.* $2.50 *net. Carriage* 25 *cents.*

Mr. Pickett states and elaborates Lincoln's proposed disposition of the negro question by assisted emigration following emancipation. The author, after reviewing the history of the problem, and discussing the present situation of the negro population, boldly argues that the nation's treatment of the black man since the close of the Civil War has been founded upon a mistaken policy. He points out the inadequacy of the currently advocated solutions of the problem, and asserts that we must return to Lincoln's simple and efficacious remedy for the national evils resulting from the negro's presence.

G.P. PUTNAM'S SONS, NEW YORK & LONDON

Chapters on Municipal Administration and Accounting

By FREDERICK A. CLEVELAND, Ph.D., of the Bureau of Municipal Research, New York City, Author of "The Bank and the Treasury," etc. Crown 8vo. $2.00 net.

*** The reason for this book is the dearth of available literature on the business aspects of government, and the many requests made for the various papers and addresses which the work comprises. These chapters have a direct historic relation to three important movements, viz.: the work of the National Municipal League, the work of the Bureau of Census, and the work of the Bureau of Municipal Research.

of CORRIE WHO?
Maximilian Foster's brilliant new story, the NATION says: *"As charming a piece of light fiction as one is likely to come across in many a day. It is a story of mystery handled very skilfully. It possesses exceptional charm of style."*
SMALL, MAYNARD & COMPANY - BOSTON

Newspapers as Historical Sources

For the period which covered Reconstruction, from 1865 to 1877, I used *The Nation* to a large extent. Its bound volumes are convenient to handle in one's own library, and its summary of events is useful in itself, and as giving leads to the investigation of other material. Frequently its editorials have spoken for the sober sense of the people with amazing success. As a constant reader of *The Nation* since 1866, I have felt the fascination of Godkin, and have been consciously on guard against it. I tried not to be led away by his incisive statements and sometimes uncharitable judgments. But whatever may be thought of his bias, he had an honest mind, and was incapable of knowingly making a false statement; and this, with his other qualities, makes his journal excellent historical material. After considering with great care some friendly criticism, I can truly say that I have no apology to make for the extent to which I used *The Nation.*—*James Ford Rhodes,* in *The Atlantic Monthly, May,* 1909.

The Nation.

NEW YORK, THURSDAY, JUNE 3, 1909.

The Week.

The affair of the mislaid document, as Sherlock Holmes might have called it, brings embarrassment even upon the usually imperturbable Aldrich. Accused of having hidden away a valuable report on manufactures and wages compiled by the German Government at the request of our Ambassador at Berlin, the chairman of the Finance Committee assured his fellow-Senators in quick succession that he doubted whether there was such a report, that it was lying about somewhere waiting to be translated, that Germany was presumptuous in trying to shape our tariff laws for us, that the report was quite useless. anyhow, and that he should be delighted to have it printed for the instruction of the Senate. In the absence of competent translators at Washington, Senator Aldrich must have gone on his own knowledge of the German language when he concluded that it would only be a waste of the Senate's time to bring the document to its attention. That Mr. Aldrich wished to prevent the report from falling into the hands of the insurgents, we hardly believe. What could the Senate leader have feared? He can afford to let the Opposition disclaim, the press protest, the House grumble, and the President cherish anxious doubts, because Aldrich has the one best answer to all—he has the votes. Why, then, should a bookful of statistics more or less bother him?

Conflicting press reports have led to a widespread misunderstanding in regard to the actual outcome of the Georgia Railway strike. It is not true that the railway has given in on the essential point—the employment of negro firemen. It conceded a number of unimportant points and signed an agreement to arbitrate the questions under the Erdman act. The first of these is the important one, for it raises the color issue in three-fold form: Shall all negro firemen be barred from employment on the Georgia Railroad; if employed, what percentage of the total number shall they constitute; and shall they retain their present privilege of promotion by seniority over white firemen? The railway stood its ground to the end, with admirable firmness, refusing to arbitrate until the arrival of Mr. Knapp of the Interstate Commerce Commission, when it yielded to pressure to the extent of consenting to arbitration. The important race question is, therefore, unanswered. Should the arbitrators be swayed by the race issue, the outcome would be serious, for it would become a precedent for limiting the employment of blacks in other directions. It would, therefore, have been better if the strike could have been settled without arbitration—but that would have had to come about by the complete surrender of the union. The railway had absolute justice on its side, and fought admirably for employees of proved worth and of long service whose sole offending is the color of their skins.

Gov. Hoke Smith can get little satisfaction out of the Southern newspapers for his attitude in the Georgia Railroad strike. The New Orleans *Times-Democrat*, after discussing his attitude, remarks that the "evil of incompetent government seems to be growing in this country, and unless there is soon a change for the better, the most serious disorders must result." It thinks that Gov. Smith had no business whatever to arbitrate between individuals, but that his sole duty was to enforce the law according to his oath of office. It also accuses men like Hoke Smith of being ready to enforce the law only when there is no personal or political danger in so doing. The Columbia, S. C., *State* avers that "the spirit of the demagogue has for long pervaded high places in Georgia," and adds, "it got lodgment in the State House, and has crowded up alongside of many an editor." It manfully declares that the people of Thomas, Georgia, have no "earthly right" to say whether the railway traversing that town shall employ negro or white firemen, or whether those firemen shall be union men or non-union men. Finally, the Macon *Telegraph* finds it necessary to demand that "the strong arm of the State should protect society against anarchy," and it denies that an "outside and vicious element which resorts to violence has any natural, legal, or moral right to imperil life and limb and property."

The election of Congressman William Lorimer as United States Senator from Illinois, to succeed Albert J. Hopkins, reflects little credit on the State. The Legislature went through the painful travail of ninety-five roll-calls, extending over more than four months, only to give us in the end this particularly small mouse. The opportunity for congratulating the State of Illinois is wanting, not because a poor candidate has been selected where a good one might have been had, but because the State's politics should be in such a pitiful welter as to make the long-drawn fight an utterly selfish and unprincipled game between politicians of a low order, and the inevitable result the election of one candidate out of a very bad lot. The new Senator was elected by fifty-five Republican and fifty-three Democratic votes. No pretence was made that this bi-partisan arrangement was anything but a bargain. Mr. Lorimer has announced no platform on which he might claim the support of even the Republican legislators.

The removal of Census Director North was undoubtedly hastened by his hostility to his official superior, the Secretary of Commerce and Labor. But Mr. North's departure for some other sphere of usefulness became inevitable after the revelation of what loyal service he did for the wool manufacturers during the last tariff revision, whenever Senator Aldrich was ill and the other members of the Finance Committee did not know what it was all about. One admirable thing about our straightforward President is that he takes no pains to conceal what is meant by the "resignation" of an official against whom just cause of complaint exists. Mr. North's resignation, we are told from the White House, "was based on the ground that, on account of conditions existing and likely to continue, his administration of the office would probably not be successful." The unfavorable conditions with which Mr. North would have to contend were presumably that he might turn up some morning to

find his office door locked against him by order of the President.

Mr. Harriman's interview on the financial and industrial outlook is not the less interesting because pitched in some respects to a note of conservatism. That "the business of the country is now on a very substantial basis" is an assertion with which most people will agree. That Mr. Harriman "does not think the tariff legislation will be of much importance" to the financial outcome, one way or the other, contrasts oddly with the attitude of some other Wall Street oracles, who have for months been asserting that the "trade boom" was merely waiting, stop-watch in hand, for the enactment of any kind of tariff bill. Mr. Harriman even goes so far as to pay some attention to our agricultural situation and the doubts surrounding the new crop—a consideration which a good part of Wall Street seems to have dismissed as wholly irrelevant. This, furthermore, is a prediction which will make a good many people open their eyes: "We are building now firmly and soundly. If a tide of speculation sets in rapidly again, and we jump things up thirty or forty stories and then smash, the fall will naturally be greater." Saul is surely among the prophets. But Mr. Harriman guards carefully against the possibility that there was some connection between the panic of 1907 and the "jumping of things up thirty or forty stories" in the preceding twelvemonth. This Mr. Harriman denies; he would naturally deny it:

> That panic was directly caused by the extraordinary Landis decision and the general attitude prevailing at the time against the railroads and corporations generally.

No one will be astonished at Mr. Harriman's tenacity in this belief. It would be superfluous to ask just how the Standard Oil decision, extraordinary as it no doubt was, should have caused the suspension of the Knickerbocker and the run on the other trust companies, or how a court verdict in Indiana during August should have brought about panic on the Egyptian market in April and on the Japanese market in June. But perhaps this is ancient history.

Frankness is contagious. After "The Confessions of a Railway Signalman" it was certain that the railways, too, would take the public into their confidence. The Pennsylvania has now promised full publicity regarding every accident. We have not forgotten that the Pennsylvania did not kill a single traveller last year. But should all details about maimed employees, sleeping switchmen, careless yard-bosses, and slaughtered tramps be given out, we should soon have a valuable fund of information with which to shape future industrial legislation. Honestly collected, it will fix responsibility where it belongs, and tell us whether the harsh things Mr. Fagan says about railway labor-unions exceed the truth or fall short of it. Whether the Pennsylvania can live up to its programme is the most interesting question. A conspiracy of silence is supposed to exist among railway employees, for mutual protection against discharge.

We cannot but admire the infinite concern with which a goodly portion of the American press is watching affairs in Cuba. No fond mother has ever conjured up so portentous a list of perils about the head of her absent boy as we are descrying in the path of the Gomez Administration. We call that giving the Cubans a fair chance. A few months ago it was still in order to predict a revolution and the collapse of the new Administration. At the present moment, Cuba's budget is bringing on the fall of the republic. President Gomez believes that the budget will balance at about $33,000,000, but we know better. We know that the island's income cannot go above $26,000,000, and that a deficit of $7,000,000 is proof absolute of Cuba's inability to govern herself. No other government on earth is ever bothered with deficits. We have none. England has none. Germany has none. Hence the mere prospect of a deficit in Cuba is sufficient reason for wailing over the worthlessness of her people and her government. Should this alarm prove vain, we can still fall back on the chances of a revolution. True, says one critic, "the prospects of success from that kind of a move do not now seem as good as they did at first." But why lose hope? "When the sugar cane is well grown it will take a slight effort to burn a field of cane now and then." Thus if any disgruntled Cuban politician is at a loss how to start up a row and a revolt, all he has to do is to consult a file of American newspapers.

Civilization may slacken his class rush, and even tone down football rules; but the undergraduate will not have his vacations tampered with. "A death-blow to intercollegiate baseball, rowing, and track meets!" is his description of Ithaca's proposed calendar, from which all save three holidays during the year are scratched off. Professors fancy they need a few more weeks to round off their courses, but the undergraduate kindly explains that, under the steady drive from January to June, with never more than one Saturday a week in the grandstand, his nerves will tear to shreds and "frequent outbreaks of lawlessness and riot" will result. Those shredded nerves are something of a mystery. Up to commencement day you see them, and, on the next, you don't. Mr. A.B. climbs up on his seven-dollar-a-week stool, unmurmuring, and there he drives from Monday morning to Saturday noon, fifty weeks of every fifty-two. Ten years later, his chin is double and his smile as broad as ever. If you ask about the shredded nerves, he winks. It is very strange, and stranger yet when we hear students at Western universities asking for a year-round session, after the Chicago plan.

The broad streak of sanity Englishmen are exhibiting toward Holbein's "Christina of Denmark" augurs well for their recovery from the anti-German delirium. Canniness has not yet perished off their island, when art dealers cannot play patriotism for any figure they choose. At noon Tuesday the option on the painting expired, but no indignant loyalist rushed into the broker's office on the very stroke of the hour, frantically waving a fistful of £1,000 notes and crying that the American invasion must be checked at any price. At the National Gallery, it is said, visitors talked more about the absurd sum asked for the canvas than about its beauty or the necessity of keeping it at home. Well, indeed, for the cause of art, if millionaire collectors are taking their cue from such sentiments, rather than from the doubts about the Duke of Norfolk's right to sell the masterpiece. Spent for pictures in the measure that their beauty appeals to the eye, $305,000 will bring vastly more delight than can a single Holbein portrait.

When the Lord Chief Justice of Eng-

land finds it proper to denounce publicly a new British statute, it must be a pretty bad one. This the new patent law, which has been roughly handled by Lord Alverstone, undeniably is. It embodies the protective principle, since it was drawn with a view to compelling foreign owners of English patents to manufacture their products in Great Britain, or lose their rights. To attempt to manufacture work for English laborers by this device is as mediæval as our own American idea of building a tariff wall and excluding foreigners' goods, in order to compel the starting of unnecessary American factories. One of the first results of this English law was a vigorous effort in our Congress to retaliate against British patents. Fortunately, this came to naught; but the ill-will already provoked by the British action will not be easily ended. The International Chemistry Congress, before which Lord Alverstone spoke, took the proper view of the case, and resolved to agitate for a return to the old basis, on which the manufacture of a device in a country having international conventions protects the patent rights in all the other nations. As Lord Alverstone well said, if the present law remains on the statute books, it will result in people keeping their inventions secret. Why should a Liberal Free Trade Ministry have consented to such a law?

Count Zeppelin may spare Mr. Carnegie the necessity of haling Germany and England before an international court on the charge of disturbing the world's peace with battleships. After the Count's astonishing flight from Friedrichshafen to Bitterfeld and return, all of London's bogey-dressers ought to desert the Dreadnought-mad party for the airship-mad. A dirigible balloon that travels nearly 1,000 miles without once having to stop, can well leave Cologne at night and be over the Parliament towers in the dark of the following evening. Let the winds and landing difficulties handicap it as they will, nevertheless, it will convince even a Clyde calker, if it should fulfil the promise Count Zeppelin makes for it in *Putnam's* by carrying twelve persons 2,500 miles at high altitude without a descent. Mr Carnegie might well leave European diplomats to their wiles, and invite the Count to visit him at Skibo, by the overhead route, of course.

From Constantinople come rumors of impending trouble. There is discontent with the Young Turks in the capital. The various nationalities, Greeks, Armenians, and Albanians, are restless, and in Asia Minor there is danger of another Moslem outbreak. It is, of course, impossible, at this distance, to say how much truth there is in the dispatches. But, in any case, before giving ourselves up to the impression which such reports may tend to create, namely, that the Young Turks are not equal to the task they have assumed, it is only fair to compare what the Young Turks have accomplished and have failed to accomplish with what others in their place would or could have done. Say that Asia Minor is restless, and that it may be necessary to hasten an army there to prevent a renewal of the massacres, say even that the massacres come, and in what way will things be worse than they were before the Young Turks came to power? Before the revolution of last July, Macedonia was a veritable cockpit in which Bulgarians, Greeks, Servians, and Turks tore at each other and at the helpless peasantry. Ten thousand peaceful folk were slaughtered in Macedonia during the last five years. With the proclamation of a Constitution, the slaughter in Macedonia ceased. Then came the temporary eclipse of the Young Turk power in April last, and two or three days of Abdul Hamid brought on the slaughter in Asia Minor. The Young Turks took Constantinople, and the massacres ceased. Whatever errors the Young Turks in their inexperience may make, whatever mutinies they may still have to deal with, whatever hangings they may still be determined upon, is it conceivable that they will cost Turkey a portion even of the slaughter and the general wretchedness that preceded their triumph, and would accompany their fall?

The introduction of compulsory voting in Spain has brought an unprecedented number of electors to the polls. Parliamentary elections in that country are notoriously manipulated by the party in power, which can fit itself out with any majority it thinks becoming. Such control from above was made easier by the existence of the large body of electors who stayed away from the polls. These have now been brought out into the open, and as a result, in the recent municipal elections, between 80 and 90 per cent. of the entire electorate cast their votes. Apparently, Spain has been holding a large store of latent radical opinion. Although a Conservative Ministry is now in power, there were chosen 481 Republicans, Liberals, and Democrats, 253 Conservatives, and over a hundred Radicals of various shades. Madrid elected 12 Republican councillors, 2 Liberals, 1 Democrat, and 7 Conservatives, thus giving the Republicans an absolute majority. Valencia chose 15 Republicans, against 10 of all other parties. In Valladolid, 12 Liberals, 6 Republicans, and 3 Conservatives were elected; in La Coruña, 7 Republicans, 3 Liberals, and 3 others; in Córdoba, 10 Republicans, 6 Liberals, and 6 Conservatives. The growth of the Republican sentiment seems all the stranger because Alfonso XIII's popularity is apparently great.

In the June *Review of Reviews*, Edward A. Steiner has a brief but exceedingly interesting article on "How Returning Emigrants are Americanizing Europe." In 1907, for instance, nearly 800,000 aliens recrossed the ocean. In ordinary years the exodus is much smaller, but still very large. There is not a town or village of any size between Naples and Warsaw, Mr. Steiner believes, that has not its visitor or repatriated citizen from across the seas. First in importance are the savings brought back by emigrants. They buy land, and often cheaply because large estates are forced upon the market by scarcity of labor. Between 1899 and 1905, peasant holdings in certain districts of Russian Poland increased 418 per cent. In one Hungarian village the peasants, with American money, have acquired the entire manorial estate, including a fine castle. But from America come, too, a new spirit and new habits. The slow pace of peasant labor is whipped up under the stimulus of Yankee "hustle." American clothes and haberdashery are entering on wide conquests. Slav villages catch the glint of patent leather shoes and the glitter of dentist's gold, those two predominant traits of our life that struck Henry James in New York. Finally, we record the advent into the peasant hut of the doctrine of fresh air, and a marked improvement in the treatment of women.

MORE TARIFF IMMORALITIES.

Monday's tariff debate was as illuminating as any that the Senate has given us. The schedules had been reached in which the acme of protectionist insincerity and hypocrisy always is touched—the duties, namely, on food products. That is the place where the augurs of protection invariably wink at each other as they set about the task of "fooling the farmer." Having got his vote for the grand old party and the grand old humbug of the tariff, they proceed gravely to "protect" his wheat and corn and bacon and beef. This time the farce became too broad for even that skilled comedian, Senator Aldrich; and when the discussion threatened to run on interminably, and some acrimony was developed, he rose and incontinently withdrew his proposals to increase the tariff taxes on food-products. To give cynicism its crown, he then coolly stated that there would be no importations of meats, no matter what the tariff duties were; that there had been none to speak of under either the high rates of the McKinley bill or the low rates of the Wilson bill. This unblushing confession of the bunco game which has been played upon the agricultural interests of the country for forty years, naturally woke angry protests. Senator Heyburn rose to inform the Rhode Island Senator that if the farmer were once convinced that he was not going to get his share of the protectionist pound of flesh, along with the manufacturer, there would be political trouble. But Aldrich simply smiled at this threat. He has unlimited confidence in bucolic simplicity.

Readers of the Senate debate will note, however, that the case for products of the farm and orchard was instantly altered when it became a question of setting up a domestic monopoly. Mr. Root's argument against the monstrous duty on lemons demanded by the California growers was fortified by fact and reason. He showed that the existing protection was more than ample. California lemons can be laid down in New York at sensibly lower prices than the imported article, notwithstanding the cheap ocean freights as against the long haul overland. Yet it was proposed in the Aldrich bill to increase the duties 50 per cent. The object could be only to mulct the consumer, and give to the Californians a practical monopoly of the supply of a common article of food. But this demonstration was of no avail. The higher duty was voted 43 to 28. Aldrich held his men in line for this agricultural duty, despite his indifference to other schedules of the kind. The reason was, we presume, that he had bought the votes of the California Senators for the cotton and woollen and steel and iron duties, by promise of a thumping increase on lemons, and stood manfully to his bargain. Thus was protection justified of her robber children.

The whole incident recalls an historic monument of greed, which was erected for the warning of mankind at the time of the abolition of the slave trade by the English Parliament. In the long and hard struggle which Wilberforce and Macaulay made to do away with that open sore of the world, they were opposed by the contention that it would be bad for commerce; that if some thousands of innocent Africans were not exposed to the horrors of the Atlantic passage every year, several English traders would lose money. One representative of these unconscious cormorants openly declared in Parliament that the slavers furnished the only market for decayed fish and other putrid food, on which there would be a dead loss if the slave trade were outlawed. This argument is just about on a level with the elevated reasoning to which the Senate is now accustoming us. Who can doubt that, if Aldrich had to buy a vote or two for his pet manufacturers by a protective duty on rotten fish, he would do it without a blush, and, what is more, lead the whole phalanx of Senators of the party of moral ideals up to the scratch without any of them holding their noses?

Such displays as the Senate is daily giving us are enough, one would think, to convince even Mr. Roosevelt that there is such a thing as a moral question in the tariff. He could never see it; and hence always found it politically inconvenient to come out for tariff revision. But if the moralists have nothing to say about the performance in the Senate, they ought to hold their tongues about every form of cheating, false pretences, and political chicanery. If they cannot perceive the moral aspect of the tariff, suppose they try to discover its immoral aspect. Is it nothing that men stand up to legislate money into their own pockets? Is there nothing to stir indignation in the sight of Senators bargaining away every day, by the most open of log-rolling methods, the right to tax the whole community? If such a thing as political turpitude and public corruption exists anywhere, here we have it. And we repeat our firm belief that the time is rapidly approaching when President Taft will have to speak for the real sentiments of the whole people. He is reported as still hopeful that the conference committee will give him a reasonably good tariff bill to sign. It is said that he has assurances that the high duties which Senator Aldrich is now moving heaven and earth to get, are intended to be surrendered in conference. Judæus Apella may believe that, but we know not who else. The Senators are counting upon the President's easy-going good nature and party regularity In our opinion, he should soon take steps publicly to undeceive them, and to let them know that he will have neither part nor lot in what bids fair to be at once a betrayal of the Republican party and a gross fraud upon the people.

THE SAN FRANCISCO TRIAL.

A "skulking blackmailer," a "slanderer," a "briber"—these are some of the feeling descriptions of Rudolph Spreckels daily appearing in the San Francisco *Globe*, in large headlines, coupled with the oft-repeated charge that the entire campaign against Patrick Calhoun, president of the United Railways, is due to Mr. Spreckels's failure to become the traction magnate of his city. Never do we recall a more sensational trial or one more difficult for the outsider to understand. Indeed, we question whether San Franciscans themselves who are not "on the inside" have a clear perception of all that is going on, or realize fully what everything means. But, if we can judge fairly at this distance, there seems to be a growing uneasiness about the reformers that was not manifest during the Schmitz and Ruef trials. Those were such notorious rascals, it was felt, that no substantial injustice could be done, even if the prosecution took some extremely short cuts or resorted to highhanded methods.

In the case of Patrick Calhoun, the

situation is different. For one thing, wealth and position fight on his side, as does corporate influence. Nobody believes that the United Railways of San Francisco has been superior in its morality to the average city transportation company, or that its feelings would have been much outraged if it deemed it wise to pay $200,000 to secure certain favors. But even a railway president is entitled to justice in court, and the impression is gaining ground that the effort is to "railroad" Mr. Calhoun to prison at any cost, and that the daring procedure of Messrs. Heney and Burns in obtaining evidence—such as entering Mr. Calhoun's office and blowing open his private safe, under warrants of questionable validity—is not justifiable even in the endeavor to free an utterly demoralized city from the toils of scoundrels and blackmailers. For a couple of years San Francisco's destiny has lain in the hands of two men. Rudolph Spreckels has furnished the money—and been characterized publicly by Mr. Roosevelt as one of the most patriotic and unselfish of citizens—while James D. Phelan is credited with being the real power behind the throne. These men have decided who should and who should not be Mayor of San Francisco; which men should go to jail and which go free. They have been the despotic tyrants of the city, even if it be believed that they have always been wise and benevolent tyrants.

For instance, it has recently been brought out in a letter of the late Chief of Police Biggy, originally appointed to that position by Mr. Spreckels, that, having been visited by Mr. Spreckels (on November 16, last), he was told to resign because he was "surrounded by crooks" and was an "associate of dive-keepers and brothel keepers." Why should a private citizen have the right to order a police chief to resign, or, for that matter, to appoint him? Is there anything in democratic government which recognizes such a privilege? But in Biggy's case, the demand was practically an ultimatum to be obeyed, and he so felt it. The reason is simply that Mr. Spreckels has financed the reform movement. Although Mr. Heney is a public official, he has received, according to Mr. Spreckels's own testimony, $23,828.22 from Spreckels for his office expenses, while $38,400.00 has been paid to Heney's law-partner and associate, and Burns is openly stated to have received no less than $132,446.05 from the Spreckels privy purse.

Granting that this is pure civic philanthropy, it was again brought out in the examination of Mr. Spreckels himself that, just prior to the fire, Mr. Phelan and Mr. Spreckels had organized the Municipal Railways with a capitalization of eleven millions of dollars for the purpose of building underground trolley lines in competition with the United Railways. It is this fact that has led to the many reports that the real motive of Mr. Spreckels for his attack upon Calhoun was a business one, and the allegation that he expects to receive in return three dollars for every one he is now investing in reform. On the other hand, so far as the trial of Calhoun has gone, Mr. Heney has apparently woven a very strong chain of circumstantial evidence about him. There was a payment of $200,000 from the United Railways to somebody about the time the bribing was done, but no explanatory entry was made, and there is the usual profound official ignorance as to what use the money was put to.

Now, the *Nation* has only the feeling which every lover of good government must have—that it would welcome the conviction of Mr. Calhoun if the facts warrant it. The country would then be able to say that at least in one city "the man higher up" was reached; that in San Francisco Mr. Heney could do what Mr. Jerome failed, for one reason or another, to accomplish in New York. We should very much prefer to believe that Messrs. Spreckels, Phelan, Heney, and Burns are fighting the people's battle against the worst type of political corruption. But the point which we wish to make to-day is simply that even a reformer cannot turn despot and run the machinery of government himself without provoking an immediate reaction. The best kind of reform is that which comes from the people themselves by regular democratic means, and not that which emanates from a handful of men financed by the well-filled purse of a business rival of some of the men accused of wrong. Undoubtedly, we shall be told that this is a counsel of perfection; that to overthrow such a monstrous conspiracy as existed in San Francisco every possible means must be resorted to in order to ferret out the criminal; that to be practical in such matters one must not be thin-skinned, but use the power that falls into one's hands. To this we would make the reply that it is neither desirable nor practical, when in the midst of so great a prosecution, that the enlightened public sentiment should become suspicious both as to methods and motives.

THE LORDS AND THE BUDGET.

Mr. Goldwin Smith, whose interest in current politics the years are not able to dim, writes to the *Spectator* urging the House of Lords to debate, and, if desirable amend, Lloyd-George's budget. He takes the ground that the measure is political. It is not a money-bill, pure and simple, which will pass the Commons and go up to the Lords. It is, incidentally, a scheme of social reform, with a plan for readjusting taxation so as to make its burdens fall chiefly upon certain classes of the community. This being so, Mr. Smith argues, it is as much a part of the duty of the second chamber to examine and pass upon these proposals, as it was to debate the bill for old-age pensions, or the one to abolish plural voting, or to restrict the sale of liquor. It is, in a word, a question of public policy, not merely of finance.

This distinction, we fear, is not one that could be successfully upheld. The Lords are not entitled to go behind the form of a bill that comes to them from the Commons, and inquire what are its motives and purpose. If they were, there would be an end of the constitutional principle that the power of the purse resides exclusively in the Commons. It is settled that the English upper house has no voice in financial matters. The Lords can neither increase nor cut down appropriations. For them to attempt to do so now, would be revolutionary. The budget will reach them, as have all preceding budgets, with every technical appearance of a bill to raise revenue. With that, the House of Lords cannot meddle on any pretext that it is not a bona-fide financial measure. Were the Lords to arrogate any such power to themselves, there would be no limit to the lengths which they might go. The naval estimates, for example, they might cut down. They could say that provision for eight Dreadnoughts was political, designed to win votes for the Liberals; or that it was a matter vitally affecting

the foreign policy of the nation, about which both houses of Parliament had a right to express an opinion. Such a contention would not, of course, be listened to; but it would have as many legs to stand upon as the claim that an increase in the income tax, or a shifting of the land tax, is political, and therefore within the Lords' purview. Once begin letting out the waters, and there is no telling where the floods will go. We think, therefore, that the Lords will remain where the British Constitution has placed them—dammed up so that they cannot touch money-bills.

There is, however, much quiet talk in England about their doing what they have the undoubted power, if they have the stomach, to do—namely, throw out the budget and force a dissolution. Some Conservative newspapers have advocated this course, and it has been much canvassed in the clubs and salons frequented by the aggrieved victims of the budget, as they choose to consider themselves. Why not, they ask, make an end of the business at once, and get a speedy verdict of the country on this miserable and despoiling Ministry? This question has been echoed by some Conservative members of Parliament, but it is significant that none of the leaders of the party have given countenance to the impetuous suggestion. Mr. Balfour has attacked the budget repeatedly, but never has he given an intimation that it might come to grief in "another place"—to use the Parliamentary expression for referring to the Lords. When it has been intended to destroy in the Lords previous Liberal legislation—such as the two education bills, the licensing bill, etc.—there has been no lack of premonitory speech and action. Mr. Balfour has openly consulted Lord Lansdowne; the latter has begun to talk ominously about the responsibilities of the hereditary legislators. In connection with the budget, however, nothing of this kind has been observed. If the Conservatives really mean to order the House of Lords to refuse to vote it, they are keeping their intention a deep secret.

It is hard to believe that they have any such intention. The question is not so much one of political power, as of political tactics. By forcing matters, Mr. Balfour would simply risk losing what he is almost certain to gain if he bides his time. The tide is running so powerfully for the Conservatives at present that they may reasonably count upon returning to office at the next general election. And that trial of strength cannot be long postponed. Within two years it must come; it may easily come in the course of the next twelvemonth. So cool and patient a leader as Balfour is not at all likely to precipitate the struggle. And more than the mere element of time is involved. The entire issue might be changed if the Lords were to reject the budget on the ground that it bore too heavily on the rich. We should then see a great outburst of indignation at the selfishness and arrogance of the privileged classes; there would be a good chance of the socialists and the Labor Party pooling issues, for the time being, with the Liberals, so that the issue of the election would be a much less sure victory for the Conservatives than they now appear bound to win. All told, therefore, the probability is that the Lords will make wry faces at the budget, but will swallow it. Mr. Balfour will let it do its work of still further alienating rich and middle-class Liberals; will use vague phrases about undoing its injustices when his party is in office again; and when he actually is once more at the head of the government, will doubtless not remove a single one of the taxes which are now denounced as confiscatory and socialistic.

"SOCIALIZING" RELIGION.

The *Outlook* recently printed two remarkable articles by clergymen strongly attacking the education given in theological seminaries. Against it, the gravamen of the complaint is that the course is too scholastic and antiquated; that candidates for the pulpit do not get an insight into the social problems which will confront them later. The drift of the protest is practically against the old idea of a learned ministry. It is argued that a fairly educated man, "with facility of speech, a knowledge of the English Bible, and a real interest in the welfare of mankind," may be better fitted to preach than students who have put in three years at Greek and Hebrew, and have wasted a lot of time over people who "have been a long time dead." The seminaries should throw overboard the dead wood in their traditional curriculum, and put their main strength into "sociology, economics, pedagogy, and ethics." The chief aim should be to teach "the social character of religion, and, specifically, the social application of Christianity." In one word, religion should be "socialized."

This term is not defined, but its meaning, in the mouths of these men and those who think with them, is not hidden. They want the churches and the ministers to regain touch with the masses; and they believe that this can be done by an active sympathy with the causes and aspirations that to-day lie near the hearts of the masses. Workingmen are more and more standing aloof from Protestant churches; to Socialism many of them are transferring the feeling which they once had for religion: therefore, the thinly veiled argument runs, religion must take on a tinge of Socialism to win them back. The Rev. Charles Stelzle frankly puts the case in a way to show both what he thinks the trouble is to-day, and what the dominant purpose should be to-morrow:

> The profound religious spirit which is so evident in the labor movement bids fair either to capture the church or to become the heart of a great religious movement which will rival the church as it is now organized—*unless* the church herself so enlarges her life and vision as to include this movement. If once this movement of the working people takes on a distinctively religious aspect—and it is quite possible for it to do so—the church will with difficulty keep in the procession.

Such conceptions and hopes are amiable; but the fear caused by the growing alienation of wage-earners from the churches should not blind the latter. Take the great fact of the relation of the Catholic Church to workingmen. This is seldom referred to in the laments of Protestants over their slackening hold upon the toilers, yet it is most significant. Here we have a vast religious organization, the very life-blood of which in this country has been the attachment and devotion of the working-classes, but do we find it saying that it must move heaven and earth to bring itself up to date and become "socialized"? Nothing of the kind. On the contrary, the weight of Catholic authority has been cast against Socialism; and the Pope is as much opposed to "modernity" in labor and political movements as in theological. Doubtless, the Catholic Church in the United States loses its power over many immigrant and other workingmen who, by antecedent faith, ought to be in its com-

munion. But making all allowance for such defections, it retains a wonderful hold upon those very masses which, we are now told, can be won over only by petting labor unions and taking up with half-baked doctrines labelled "sociology."

If such considerations do not give our too quick religious innovators pause, let them stop to survey some of the practical and definite obstacles which they must surmount. When they demand of the theological seminaries training in economics and solutions of social problems, they are informed that such studies are pre-supposed in the students; the colleges are to furnish them with that equipment. But that is absurd, declares the Rev. Mr. Jones. "College courses cannot equip young men with the knowledge of social conditions necessary to the ministerial profession." But can seminary courses? We gravely doubt it. Many institutions, it is true, afford their students the opportunity to see the ongoing of organized Christianity on a large scale—the institutional church, clubs, classes, missions, settlements—and all this is no doubt instructive and humanizing. But formal "sociological" teaching, dovetailed into an already crowded and hurried three years' course, would not, in our opinion, be much more successful in the seminaries than it is in the colleges. The most probable result would be the letting loose in pulpits of crude notions about "the social applications of Christianity," together with sadly muddled economics.

After all, we come back to the truth that the successful minister is born, not made. By the use of whatever tools, vitalizing even the oldest and mouldiest conventions, he comes to his real work by virtue of qualities which a theological education can neither give nor take away. If he has the soul to endure as one seeing the invisible, and a heart to throb in unison with all the varied humanity about him; and if to all this he adds the sense of a high mission and the burden of a spiritual message, he need not trouble himself overmuch to become "socialized." He will find his true power and wield it. Into the striving and sorrow of the world, he will be able to bring something of peace and comfort; and will be the better enabled to do it for having braced his mind by hard study and fed his spirit by long meditation while the fire burns, than by taking out a card in all the labor-unions from here to California, or running, now here, now there, after the latest sociological fad.

MISTAKES ABOUT LEISURE.

Among the mistakes about contemporary life, perhaps none passes muster so readily as the one about leisure and our leisure class. It is taken as self-evident that what goes by the name of leisure here is either gilded indolence or else something worse. Here and there one finds an idle millionaire "that in trim gardens takes his pleasure," but all the rest, who neither toil nor spin, must be looked for on the sporting page or the police blotter. The average rich man who feigns leisure is generally using it, as Machiavelli's prince did, as a breathing-time to contrive plans for war—to wit, a Wall Street campaign. A. Barton Hepburn, in the June *Century*, sums up this popular impression and neatly turns it into an apology for the American business man, when he says:

> America possesses comparatively few old families, . . . reserving sufficient time and strength for the development of the higher ideals of life. . . . Retiring is difficult, largely because there is no inviting field for them to enter. We have no leisure class devoted to the general purposes of life, whose ranks open invitingly and furnish a proper goal to the business man's ambition. . . . A man out of business . . . is out of countenance with current events.

Now, all this was the simple truth only a few years ago, but society has been changing since then more rapidly than opinions about it. A class "devoted to the general purposes of life," after the fashion of Sans Souci and the Paris *salons*, we cannot boast. The tides of life have set too strongly against it. But leisure and the opportunity to pursue high ideals have not died with it. What has changed is the organization of the leisure class. Like the rest of the world, it has been blown to bits by specialists. Probably this city alone holds as many amateurs of culture as eighteenth-century France ever did; but they are scattered about in art clubs, historical societies, political leagues, scientific circles, and colleges, each taking his leisure chiefly within his own trim garden, because he finds there so much to pluck and smell. Correggio, Anglo-Russian relations, and the nebular theory are no longer served on the same conversational menu; there is a table for each.

Leisure has undeniably become more strenuous, as a result of this opulence and virtuosity. To call it loafing is to confess one's ignorance of the joyous labors which even humble intellectual hobbies, say orchids and sociology, afford. Indeed, a mind fit to pursue the things of the spirit at all is more likely to lie awake nights than to doze away its days over them. There will always be shopkeepers to see in such zeal only a disguise for indolence, but they can sway none but those who share their repugnance toward the ideals of culture. It is doubtful if our leisure class has lost many desirable members because of the tradition that a man out of business is a pariah. Those whom it does deter would, if the tradition were annulled, become the most crotchety of putterers in whatever field of culture they invaded. Like an unhappy rich man whom Mr. Hepburn cites, they would travel feverishly and then weary of every scene; "study" Flemish art, buy some canvases, fall victims to a dealer, and soon sicken of the whole business; and, finally, after having made the round of a half-dozen hobbies, plunge back desperately into the Street. Such men think leisure means idleness, sweetened with something a little more saccharine than vaudeville, and considerably more expensive. They know they could buy idleness with dollars at any time of life, and so they fancy that they could as easily join the true leisure class. But the kingdom of higher ideals must be sought early—best while the dew still lies on life; and the admission fee is "the passionate vision."

The business man with this vision need never complain that America has no leisure class, or that its ranks do not "open invitingly," or that it does not "furnish a proper goal for his ambitions." Every large city will give him companions for his lighter intellectual moods. If he aspires high in science, art, politics, or social reform, at least our great centres teem with like-minded men. And should his attainments rise to the same level, universities will welcome him, dignifying his leisure with a few routine lectures. If, finally, he must keep up the business pace, there are public offices to be filled and political rings to be shattered.

GEORGE MEREDITH.

I.

The refusal of the authorities of Westminster Abbey to allow George Meredith to sleep among the dead whom England delights to honor was by no means surprising. In spite of the endorsement of the Society of Authors and the Prime Minister, the future of his reputation still remains in a high degree problematic. If he had died twenty-five years ago, though the work on which his fame must rest had then been accomplished, it is doubtful whether the general voice would have decreed him this solemn tribute. Indeed, from his first appearance in literature down to the time of his death no writer of his power had received less recognition for his virtues or more persistent praise for his faults. George Eliot, Swinburne, Watts-Dunton, and a following of enthusiasts felt his might, and for the most part tried to persuade the world that he was a great literary artist. Others asserted with equal vehemence that he was an incoherent thinker, making his artificial, choked, and stuttering novels the vehicle for a mass of epigram. The so-called man in the street, if he chanced to overhear the discussion, promptly decided that it did not concern him, either way. If Meredith attended to the early notices of his books, he must often have sighed as one who watches for the morning. Even so late as 1880 the *Westminster Review*, traditionally favorable to his reputation, commented upon the recently published "Egoist"—now often considered his weightiest contribution to fiction—as follows:

> Mr. Meredith is, perhaps, our most artistic novelist, and, for that very reason, by no means popular with mere subscribers to Mudie's. His audience is few, but fit. . . . He is, in a word, what the world would vulgarly call too clever. . . . This is Mr. Meredith's great fault—he overdoes his cleverness. If he was more simple, he would be far more effective. "The Egoist" is full of poetry, subtle observation, and sparkling epigram.

This review, with its emphasis upon the literary artist, is typical, and, unless I am mistaken, is about the quintessence of bad criticism. For it has yet to be demonstrated that perfection of art has interfered with the success of any matter whatsoever, even among the subscribers to Mudie's. And those who value Meredith's work most wisely will not extol him for his artistry, but rather deplore his lack of it as one of many obstacles that have stood in the way of his popularity. Furthermore, to say that he "overdoes his cleverness" is to suggest that he consciously strains for effect. If this critic had really been one of that piteous fit audience though few, he would rather have suggested how insuperably difficult it was for Meredith not to be clever, how utterly impossible it was for him to be simple, how entirely regrettable that he did not receive an English academic training. How might not the Oxford culture have disciplined his Celtic lawlessness and subdued his turn for "natural magic"! Welsh and Irish in ancestry, Meredith was educated at a Moravian school in Germany. In the plastic time of his youth, he, like Browning and Carlyle, was his own master of rhetoric. Like Carlyle, he wrote prose as if Dryden had never shown the superiority of Charles the Second's English to the flowered and conceited exuberance of the Elizabethans. Like Browning, he wrote verse as if Pope had not died to save us from the sins of the metaphysical school. If Donne, as honest Ben declared, for not keeping of accents deserved hanging, so did Meredith. He wanted art. He was not wanting in a perception of the supreme beauty of style—perfect identity of thought and expression. In his essay on the "Idea of Comedy" he showed the keenest critical appreciation of the style of Menander and Terence, writing almost with rapture of their "Elysian speech, equable and ever gracious." But two years later, in the prelude of the "Egoist," he was guilty of such sentences as this:

> Who, says the notable humorist, in allusion to this book [Book of Earth], who can studiously travel through sheets of leaves, now capable of a stretch from the Lizard to the last few pulmonary snips and shreds of leagues dancing on their toes for cold, explorers tell us, and catching breath by good luck, like dogs about a table, on the edge of the Pole?

II.

He wanted art no less as a story-teller than as a stylist. It is true that he undertook a very difficult task. He desired to represent men and women dramatically, revealing the secret springs of their characters in their speech and acts. But for fatally long periods in many of his novels he would allow them neither to speak nor to act. Sometimes, like the messenger of the Senecan tragedy, he reported the great things that were going on behind the scenes. Sometimes with a kind of choric fury he drowned the voices of the actors and assaulted the ears of the audience with a prolonged and often partly enigmatic commentary. Sometimes he translated whole conversations into telegraphic Meredithese. These methods of telling a story are inartistic, because they deprive the auditor of the legitimate and expected pleasure of hearing the *ipsissima verba* in the critical moment, and the spectator of seeing the decisive gesture with his own eyes. Defenders of Meredith will say that he was bent on our perceiving the finer meanings of act and speech, and that he could be sure of his purpose by no other method. That is to confess again that he wanted the skill of the supreme literary artist, that his intention was greater than his power. He had himself a subtle sense of the deeper implications of speech, but he did not possess steadily that master instinct which finds a single word to tell all. When Romeo is banished from Verona, the nurse urges Juliet to marry Paris. Then follows this dialogue:

> *Jul.* Speak'st thou from thy heart?
> *Nurse.* And from my soul, too; else beshrew them both.
> *Jul.* Amen!
> *Nurse.* What?
> *Jul.* Well, thou hast comforted me marvellous much.
> Go in; and tell my lady I am gone,
> Having displeas'd my father, to Laurence's cell
> To make confession and to be absolv'd.

What more can one desire? Could forty pages of commentary add anything to that one incomparable Amen? That is what a literary artist does with conversation. Shakespeare's plays are sown with such volume-speaking words; in Meredith's novels I do not know where you will find anything approaching it.

III.

But if Meredith was not a first-rate literary artist, is it possible that he was a first-rate literary genius; or are the two things inseparable? It would be gratifying to find some substantial ground for the apparently extravagant claims of his friends. One of them, Robert Louis Stevenson, has been convicted before a just judge of uncritically juxtaposing Meredith and Shakespeare in the enthusiasm of his admiration for "Rhoda Fleming." Looking through Stevenson's letters, however, I have been pleased to observe that he says very little about Meredith as a literary artist. In Sidney Colvin's two-volume edition under the date of 1879, when "The Egoist" was published, there is a single reference as follows: "Chapters viii and ix of Meredith's story are very good, I think." That is all—and he had met the author in 1878, and they had become warm friends. But three years after that not ecstatic comment, he, in a letter to W. E. Henley, lists among those worthy of being honored with a dedication, "George Meredith, the only man of genius of my acquaintance." "Talking of Meredith," he continues significantly, "I have just re-read for the third and fourth time 'The Egoist.' When I shall have read it the sixth or seventh, I begin to see I shall know about it. . . . I had no idea of the matter—human, red matter—he has contrived to *plug and pack* [the italics are mine] into that strange, admirable book." Finally, with a passing glance at George Eliot, whom he could seldom mention with entire decorum, he concludes: "I see more and more that Meredith is built for immortality." A book so plugged and packed with matter that it took four to six readings to extract its meaning certainly did not

represent Stevenson's ideal in art. The full explanation of his enthusiasm does not appear till 1884, again in a letter to Henley. This time it is as plain as you please: "My view of life is essentially the comic; and the romantically comic." Then, after more comment on Meredith: "The comedy which keeps the beauty and touches the terrors of our life (laughter and tragedy-in-a-good-humor having kissed) that is the last word of moved representation; embracing the greatest number of elements of fate and character." Stevenson mightly fairly call the man a genius who had taught him his literary gospel and shown him a reasonable way of envisaging life.

There are numerous indications, some of doubtful value, that the followers of Meredith are shifting to this more stable ground. The select literary clubs, which in the old days used to read the riddle of the Sphinx in "Childe Roland," discovered some time ago that Meredith's "Readings of Earth" were less trite and equally difficult. Some of the novels, too, have attracted those curious persons who find their chief pleasure in perusing what their friends declare impossible. Within four or five years as many books have been devoted to the exposition of Meredith's art and ideas, not all of which are harder to read than the works which they explain. But chiefly we must reckon in the decisive tribute of the younger generation of writers who by imitation and open avowal declare their deep indebtedness to him. "At the present moment," says Mrs. Craigie, "all the most worthy English novelists, with the exception of Thomas Hardy, are distinguished disciples of George Meredith." The heterogeneous character of the alleged Meredithians—Stevenson, Du Maurier, Henley, Sara Grand, Anthony Hope, Maurice Hewlett, W. G. Locke, George Bernard Shaw, G. K. Chesterton, and many others—is extremely suggestive. It means that to young authors he has not been primarily a literary model—those who have caught most of his spirit have least imitated his style. It means that if Meredith is "built for immortality," he will survive not merely as an epigrammatist, or as a subtle poet, or as a psychologizing novelist, but as a man with a mine of vital ideas, a constructive critic of life, if not an artist, at any rate a genius, one of the spokesmen and master spirits of his time.

IV.

Herein lies one of his most indubitable claims to genius—he solved the problems of our contemporary literature half a century before it existed. Though his exposition was unequal to his insight, and his own coevals missed his points, such of our authors to-day as face the future smiling have found him out. The problems of contemporary literature are manifold in appearance, but in essence single: How to present a view of life both wise and brave, answering to experience as well as to desire, serviceable in art or the daily walk? Single in essence, in appearance they are manifold: How to give pleasure without corrupting the heart, and how to give wisdom without chilling it? How to bring into play the great passions of men without unchaining the beast? How to believe in Darwin and the dignity of man? How to believe in the nerves without paralyzing the nerve of action? How to recognize the weakness of man, and not forget his heroism? How to see his acts, and believe in his intentions? How to renounce his superstitions, and retain his faith? How to rebuke without despising him? How to reform society without rebelling against it? How to smile at its follies without contempt? How to believe that pain is invincible, and that joy is invincible, too? How to believe that evil is fleeing forever before good, but will never be overtaken and slain? How to look back upon a thousand defeats, and yet cling to the fighting hope? If you go through this list of questions, you will not find one which Meredith did not answer. Long before Mr. Shaw broke into mock Mephistophelean laughter, and Mr. Chesterton discovered his loyalty to the universe, when they—if one can conceive such a thing—were quietly sleeping in their cradles, George Meredith had already bottled their thunder.

"Richard Feverel," published in 1859 with "The Virginians," "Adam Bede," "The Tale of Two Cities," and "The Origin of Species," was a repudiation and a prophecy, but was recognized as neither. The *Westminster Review*, though perceiving in it observation, humor, passion, and tenderness, declared that the "book offers no solution of any of the difficulties it lays open to us; the nineteenth century struggles through it with but faint glimpses of its goal." With interspersed hints in subsequent novels, with critical prefaces, and with poems Meredith tried to amend the reviewer's error, but not till 1877 when, Aristotle to his own dramatic cycle, he published the "Idea of Comedy," did he finally make clear his message. From that time it began slowly to be evident that he had made his novels, after all, but the vehicles of an impassioned conviction. He, like so many earnest men of his century, had sought a way of salvation from skepticism, melancholy, *ennui*, and despair; and he had found a way. Other men had other remedies. For Newman the "one thing needful" was to submit to authority and enter the Roman fold. Carlyle thought the best that could be done for a man was to find him a master, and set him to work. For Mill the key to happiness was free logical discussion in the interests of humanity. For the men of science it was the following of truth wherever it leads. Arnold held that none of these things was of importance in comparison with the ability to recognize the grand style wherever one found it. To those who have read intelligently Meredith's "Idea of Comedy" I do not think it will seem an anti-climax to say that he believed the one thing needful, synthesis of all needs, was to instruct men in the proper uses of the comic spirit that they might laugh and be laughed at unto their souls' salvation. For to him the comic spirit is a fine celestial sunlight in the mind, answering to the theological grace of God in the heart, which preserves those into whom it passes from a very evil thing. It is not hostile to prayer, nor to labor, nor to logic, nor to truth, nor to grandeur, but very friendly to them all. It keeps prayer sweet, labor cheerful, logic sane, truth serviceable, and grandeur human. But over every form of animalism, egotism, sentimentalism, cowardice, and unreason, "it will look humanely malign, and cast an oblique light on them, followed by showers of silvery laughter." For, to quote from the ode to the same beneficent spirit, it is the

> Sword of Common Sense!
> Our surest gift: the sacred chain
> Of man to man.

V.

Once grasp that idea of comedy and you suddenly find yourself at the centre of a coherent critical system. You open his works anywhere and you find yourself at home in an ordered world. You perceive why the younger generation is turning toward him, and you see the relation in which he stood to his fellows in fiction fifty years ago The definitions by which in the essay the comic spirit is isolated furnish a complete critical arsenal. "The sense of the Comic is much blunted by habits of punning and of using humoristic phrase; the trick of employing Johnsonian polysyllables to treat of the infinitely little"—that does not by any means dispose of Dickens, but it casts an "oblique light" upon him. Much more penetrating is this: "Comedy justly treated . . . throws no infamous reflection upon life." How that judges the all too frequent passages in the novels of Thackeray like the following:

> "Oh, Mr. Pendennis! (although this remark does not apply to such a smart fellow as you) if Nature had not made that provision for each sex in the credulity of the other, which sees good qualities where none exist, good looks in donkeys' ears, wit in their numskulls, and music in their bray, there would not have been near so much marrying and giving in marriage as now obtains, and is necessary for the due propagation of the noble race to which we belong."

That principle is far reaching; it con-

demns in a single breath the whole miasmic marsh-land of naturalism. "It is unwholesome for men and women to see themselves as they are, if they are no better than they should be"—there is the ethical, or, if one prefers, the sanitary, plank in the platform of the new idealism. "The same of an immoral may be said of realistic exhibitions of a vulgar society"—there is the repudiation of wide wastes of the dryasdust realistic fiction, a much-needed denial of the democratic notion that all subjects are fit for art. In some of the poems the Comic Spirit becomes almost truculent in its glee. It is clearly so in pitching upon any theatrical rebel against society; for example, in the verses called "Manfred":

Projected from the bilious Childe,
This clatterjaw his foot could set
On Alps, without a breast beguiled
To glow in shedding rascal sweat.
Somewhere about his grinder teeth,
He mouthed of thoughts that grilled beneath,
And summoned Nature to her feud
With bile and buskin Attitude.

Meredith arrived a little too late to play Childe Harold or Don Juan; but if he had not been protected by his guardian spirit, he might easily have taken a part in that more plaintive and dismal literature of despair represented by numerous poems of Matthew Arnold. In the crushed and crabbed verse of Meredith's jibe at Arnold's "Empedocles," I confess to finding something very tonic, something that Arnold as critic would have himself called tonic:

He leaped. With none to hinder,
Of Ætna's fiery scoriæ
In the next vomit-shower, made he
A more peculiar cinder.
And this great Doctor, can it be,
He left no saner recipe
For men at issue with despair?
Admiring, even his poet owns,
While noting his fine lyric tones,
The last of him was heels in air!
. . . . . .
Each life its critic deed reveals;
And him reads Reason at his heels,
If heels in air the last of him!

VI.

But what has comedy to do with tragedy, and how do they become tragi-comedy? Well, in the luminous intoxication of the morning following the symposium, Socrates forced Agathon and Aristophanes, who alone had stayed it out with him till cock-crow, to confess not only that tragedy and comedy may be composed by the same person, but also that "the foundations of the tragic and comic arts were essentially the same." Aristodemus, who reported the conclusion of the dispute, was unfortunately asleep during the discussion. With this, for that reason, unexplained opinion of Socrates, Meredith was obviously in accord. To his view, life is neither wholly comedy nor wholly tragedy, but both at once. In order to distinguish either element one must be able to distinguish both; the comic spirit, one may almost say, is that which perceives the tragic fault. In order to represent life bravely and wisely, one must see it steadily, and see it whole. Such sight is given only to deep and grave heads. Those endowed with this vision discern that the great girders which bear up the world of man are the discipline of the passions by the mind, loyalty to reason, and faith in civilization. Whatever forces attempt to weaken these girders—the cynicism of Don Juan, the despair of Empedocles—the Comic Spirit holds them, to adopt the Cæsarian euphemism, *in numero hostium*—puts them to the sword of common sense. The discernment that these great girders are essential to civilization, and the loyalty which in grave men springs with the discernment, underlie every true comedy and every true tragedy. But the struggle which most men undergo in disciplining their passions, learning to walk in the light of reason, and preserving their faith in civilization, is a strange series of ups and downs. Comedy attends to their foolish falls; tragedy to their painful failures; to represent the whole course of the struggle is to write tragi-comedy.

Tragi-comedy as the position of equipoise in life and art—that, in Meredith's time, was a notable discovery. When we attempt to measure his achievement we should not lose sight of the originality, the scope, and the difficulty of his design. He planned to produce thoughtful laughter, an aim which demanded that the characters in his novels, as well as in his audience, should possess some of the culture of the drawing-room. But he planned at the same time to move the great passions which are generally attenuated under intensive cultivation. Since the Restoration they had almost disappeared from the fiction of high life. Wordsworth had been obliged to seek out the great universal impulses in the cottages of Cumberland peasants. The Brontës studied them in mad country squires. George Eliot found them among the yeomen of Warwickshire. Even Thomas Hardy has had to resort to shepherds and dairy-maids—so fugitive is our sense of solemn splendor from the roar of cities and civilized men. But what pitiful antagonists of destiny these rural people of Mr. Hardy's make. The intelligence of mortals is wholly inactive in the combat. In condemning the ways of God to man this grim artist seems obsessed by the idea that all nature is conspiring to bring a helpless humanity to degradation and shame. That is hardly to see life whole. Meredith sought his splendor in another place. His problem was how to make tragedy and comedy meet together in the drawing-room. Comedy was there to stay; but as for tragedy, Thackeray, for example, avoided it. Dickens and his public really preferred murder. To his fellows in fiction Meredith owed very little. On his serious side nearest akin to George Eliot, he preceded her into the field. Carlyle and Browning and Wordsworth were all his natural allies, but his master was Shakespeare. From him he learned to choose out for the favorite theatre of his play a country-house, where, as in a court, were assembled enough actors of civilized life to be visible against the scenery. From him he learned to let poor clowns play humble parts, and if any one had to be sent out on a barren heath to send a king who even in madness was a match for the storm. From him he learned to line the back and sides of his stage with the gray and middle ages of wisdom, pedantry, sanctity, craft, and cynicism; and then to release in the foreground young Romeo and Juliet, or Perdita and Florizel, or Ferdinand and Miranda to discover the brave new world under a stinging rain of comment from prudent or disillusioned antiquity; and then, at last, whether to youth and beauty the vista of days opened smiling, or whether some dire mischance closed their fond eyes forever, to intimate that to youth belong the untrodden ways.

VII.

Meredith's life began and closed on that note. In an age when a general disintegration of ideas was taking place, he showed an extremely keen sense of what was permanent and what transitory. He woke early to the necessity and the possibility of a new organic synthesis. Though his creative power and craftsmanship were inferior to his critical faculty, they worked harmoniously, and, therefore, effectively. Several of his contemporaries possessed separately in a higher degree the intellectual or emotional powers with which he was gifted; but no one of them fused within himself so many and so diverse powers. In close touch with distinguished utilitarian and positivist leaders, though he did not subscribe to all their philosophical and political doctrines he heartily partook in their sense of stern responsibility to society and in their resolution to make war without truce against the confederated lusts and egotisms of the unredeemed animal man. His sonnet to "J. M." is almost Miltonic in its note of militant resolution:

Our faith is ours and comes not on a tide:
And whether Earth's great offspring, by decree,
Must rot if they abjure rapacity,
Not argument but effort shall decide.
They number many heads in that hard flock:
Trim swordsmen they push forth; yet try thy steel.
Thou, fighting for poor human kind, wilt feel
The strength of Roland in thy wrist to hew
A chasm sheer into the barrier rock,
And bring the army of the faithful through.

Few, indeed, are the writers of fi
who have striven so steadily to
and conserve for posterity all the s
ideas afloat in their time. In these
lines from "A Reading of Earth"
touch upon the controlling principl
all Meredith's work:

Thou under stress of the strife,
Shalt hear for sustainment supreme,
The cry of the conscience of life:
Keep the young generations in hail
And bequeath them no tumbled hou

"HE WILD GEESE FLY THAT WAY."

HE EDITOR OF THE NATION:

Although I made a pretty thorough
of English birds on English ground
years ago, yet my observations did
ver winter weather, and so failed to
light on a remark of the wise Fool
ear"; "Winter's not gone yet, if the
geese fly that way."

lf-suspected this might be one more
ace of Shakespeare's inaccuracy in
al history. A recent article in the
n *Times* confirms, however, the in-
tation I made some years ago; name-
"the Boston *Transcript*, March 25, 1903.
commentators have not explained the
al history of this sentence in "Lear,"
ugh in England even a reader of
speare might not at once remember
fact that explains it; namely, that in
e winter weather a sudden drop in the
erature to the north and east will at
s up southward winter migrations
kinds of birds, similar to the familiar
migration. The Fool refers to one
se winter migrations, showing the
nce of severe weather to the north.
erica we are familiar only with a
autumn migration south and a main
migration north. But the Fool in
' in his metaphor points to the fact
stead of the birds flying north in
it is still so cold that they are
south in one of the familiar south-
winter migrations.

London *Times*, in the article to
have alluded, speaks of "the winter
which stream across the sky in win-
nds from the north," and remarks
even in the mildest seasons there
nter immigration into Britain which
bably on as large a scale as the more
r movement in spring." And again:
e within the last three years the nor-
inter movements of the birds which
our islands at this season have been
ified by a sudden burst of cold wea-
at Christmas time into a vast and
taneous migration to the warm south-
[into Cornwall, especially]." In his
esting article on the subject the *Times*
r specifies starlings, jackdaws, wood-
ons, fieldfares, thrushes, plover, etc., as
er migrants. In Shakespeare's day (as
act now), wild geese were and are such
rants and the clamorous wedgy cara-
s of these birds were probably as con-
cuous against their skies as they are

(or were) against ours in eastern America. I say "were," but perhaps should not have done so; for I recently heard the Massachusetts State ornithologist assert publicly that the wild geese on the New England coast were holding their own against the pot-hunters, although other game birds are not. WM. SLOANE KENNEDY.

Belmont, Mass., May 18.

THE BIBLE AS LITERARY MODEL.

TO THE EDITOR OF THE NATION:

SIR: Most of the recent discussion of the Bible as a "literary model" seems to me to have been not only at "cross purposes" (as suggested in a letter to the *Nation* of May 20), but wholly beside the point. I did not fancy till I read some of the opinions expressed that any one seriously supposed that the Bible should be used as a model for literal imitation in composition classes—any more than Chaucer, Spenser, or Browning; and I do not believe that the conference, in selecting it, had any intention that it should be so used. Surely the list of books "for reading" is designed to serve, not as models for composition, but as a reasonable list of works by great authors with whom every boy should be generally familiar. It may (incidentally—it must in part—serve the further purpose of inspiration and example in composition; but certainly few of the books on the list—the Bible perhaps least of all—have been put there as models for imitation. Indeed, it seems absurd that any one could, without humorous intent, have brought forward such a proposition. The omission of the Bible because it is unfitted for classroom use as a "specimen" would imply the omission, as well, of at least fifty per cent. of the books on the list. For who ever taught his classes to write Chaucerian English? Did those grave teachers who now question the value of the innovation—did they aforetime drill their pupils to write after the manner of Shakespeare?—or of Carlyle?

The Bible, like the rest of the books, was put on the list "for reading." If we can teach our boys to love good books—or at least to understand a few of them; and if we at the same time spare no insistence on the true if trite essentials of composition, we may then haply discover in their writings reminiscence of the Bible and of Shakespeare. It is to little purpose that they should lug in pompous quotations at every turn, but it is to infinite purpose that they should make the reader feel that they could quote an if they would. In other words, there must be no false faces; if a boy is to write Biblical English, it must first have "gone," as the Germans say, "over into his flesh and blood." That this assimilation results only from intelligent, sympathetic reading no one questions. It seems, therefore, delightfully incontrovertible that a book which has been for three centuries the informing power of the best English style, and which has exercised that power by being read and re-read, should still be read. It is really another question, and one which concerns individuals, whether one teacher should force his pupils to imitate Biblical style or whether another may hope that his pupils, by learning to know and love the book, will miraculously absorb some spirit of it into their compositions. Such imitation has been and such miracles have been; but, whether or not, they do not essentially affect the value of the Bible as a book on a list "for reading."

WALTER S. HINCHMAN.

Groton, Mass., May 21.

THE ORIGINAL MARATHON RUNNER.

TO THE EDITOR OF THE NATION:

SIR: The story to which your correspondent W. C. L. refers, containing the epigraph—χαίρετε, νικῶμεν—of Browning's "Pheidippides," dates from the second century A. D.—at least 600 years, therefore, after the battle of Marathon. It occurs in Lucian's "Slip of the Tongue in Salutation" ("Pro Lapsu inter Salutandum"). Lucian is not ignorant of the Homeric use of the word Rejoice in salutation. Indeed, he quotes Iliad ix, 225, and expressly says, "Joy is a very ancient greeting," so that his later statement seems somewhat at variance with this. He tells the story thus, in the translation by H. W. Fowler:

> The modern use of the word dates back to Philippides, the dispatch-runner. Bringing the news of Marathon, he found the archons seated, in suspense regarding the issue of the battle. "Joy, we win!" he said, and died upon his message, breathing his last in the word Joy.

It will be observed that the name of the runner is here Philippides, not Pheidippides, and indeed the former is the usual spelling—only Herodotus, I believe, and he not quite certainly, being authority for the form Pheidippides. ALBERT S. COOK.

Yale University, May 27.

TO THE EDITOR OF THE NATION:

SIR: The query in the *Nation* of May 27 has doubtless been raised by many, and the story has been absolutely denied in some newspapers. It is, indeed, not given by Herodotus, but by Plutarch ("De Gloria Atheniensium," 3), who says that "most authorities" give the name of the runner as Eucles, but that Heracleides Pontus calls him Thersippus. The Pheidippides story is, of course, a different one.

Plutarch says that this Eucles ran "in full armor" (which might exhaust even a present-day athlete) from Marathon to Athens, and breathed forth his life with the words χαίρετε καὶ χαίρομεν—"Fare well (or "Greeting") *we* are faring well"—a phrase not easily translated, owing to the double meaning. F. G. ALLINSON.

Brown University, May 27.

TO THE EDITOR OF THE NATION:

SIR: On reading the letter of W. C. L. in respect to the legend of the Athenian soldier who ran home from Marathon and died as he announced the victory, I turned to the pages of that Rollin whose ancient histories were among the delights of my boyhood sixty years ago, and found in his Book VI, chapter 1, section 7, iii, the story credited in his note to "Plut. de glor. Athen. p. 347." The Greek exclamation there given is, χαίρετε, χαίρομεν. I have not a complete Plutarch at hand, but it will not be difficult for W. C. L. to ascertain whether the citation of Rollin is correct or not.

THERON WILBER HAIGHT.

Waukesha, Wis., May 28.

THE EMPHATIC SO.

TO THE EDITOR OF THE NATION:

SIR: In the last *Nation* you printed a timely warning from a correspondent in Rome against the "pleonastic so." It is reassuring to find that even the monuments and pleasures of the Eternal City cannot suffice to divert a well-regulated mind from the niceties of syntax and etymology. But your correspondent seems to have forgotten that "so" can also be used with perfect propriety for emphasis. It is so easy to have one's impression of the Colosseum spoiled by a misplaced comma! X.

Cambridge, Mass., May 30.

Notes.

J. A. Hammerton has written a volume on "George Meredith in Anecdote and Criticism," which will be published this month by Grant Richards of London.

B. W. Dodge & Co. announce a translation of the complete works of Émile Zola. Some of his novels will here appear for the first time in English, not to mention his critical and dramatic work which has been little read in this country. Each volume will contain a preface by some critic of note. About twenty-five volumes of the fiction will be issued first.

It is a fact worth noting that since its publication in 1898 more than one million one hundred thousand copies have been sold of "David Harum."

Marcel Prévost has been elected a member of the French Academy in succession to the late Victorien Sardou. Prévost first attracted attention by his "Lettres de femmes" in 1892. In other books he dealt with the education and life of young girls.

The Académie Française has awarded a number of its annual prizes. The Prix de Poésie, on the subject "Le Drapeau," went to three writers, of whom Maurice Couallier received 2,000 francs. The Prix François Coppée (1,000 francs) was awarded to Gustave Zidler for his "Terre divine." The Prix Santour (3,000 francs) was divided among Théodore Rosset, M. Verier, and M. Onillon. The Prix Langlois went to Professor Legouis and Georges Duval for translations from the English. The Prix Archon-Despérouses, for the encouragement of young poets, was bestowed upon Abel Bonnard, Jean Balde, and Mlle. Jeanne Nels.

A modest little volume which, in the rush of books, may easily be overlooked is "The Two Travellers," by Carlota Montenegro (Boston: Poet Lore Co.). It is composed of slight sketches, fables, parables, motifs, if one may borrow the word of the lace-makers—highly elaborated little moments of human existence, either possibly real or purely fabled, which throw light upon one and another of the deeper recesses of the deceitful human heart. This is a form of writing which usually degenerates into the commonplace and the obscure, but in this case there is revealed no slight degree of true poetic insight. The book is one of distinct promise.

A Philadelphia imprint upon a French book is enough of a rarity to draw attention to "L'Évolution de l'arbitrage internation-

al," by Thomas W. Balch (Allen, Lane et Scott). This is a reprint of an article contributed by the author last year to the *Revue de Droit International*. One notes with some surprise, lack of reference to Prof J. B. Moore's monumental work on the history of arbitration.

An echo of the report of the Poor Law Commission, for which the English government could not wait before proceeding with its scheme for old-age pensions, comes in the shape of two volumes by way of Minority Report. They are edited by Sidney and Beatrice Webb (Longmans, Green, & Co.), and are entitled, respectively, "The Break-up of the Poor Law" and "The Public Organization of the Labor Market." The evidence is, of course, the same as that embodied in the report of the majority, but it is marshalled differently, and the inferences drawn are different. Both statistics and their interpretation are of great value to all who would know how complex are the problems of poverty in an industrial age, and how still more complex is the question of attempting to relieve it by state action.

Prof. Harold C. Goddard of Northwestern University has issued a reprint of his article on "Chaucer's Legend of Good Women," which first appeared in the October and January numbers of the *Journal of English and German Philology* (Urbana, Ill.). His main thesis is that Chaucer's poem was intended as a humorous satire on women, and that accordingly none of the tales it contains really illustrates properly the devotion of woman or her martyrdom for love. In our judgment, the author fails to establish his point. Whatever may be said of some of the heroines in other respects, Cleopatra is the only one who does not fit well into a group of martyrs for love, and there is something to be said on the other side even in her case. It is to be remembered, too, that these were the heroines of the most famous love-stories in the world; it was natural that Chaucer should have been tempted to choose them, even if they had suited his purpose less perfectly than they do. It is not fair to select the occasional humorous lines which one is sure to find in Chaucer, whatever the subject treated, and base a theory on them to which everything else is forced to conform. Even the fact that Chaucer dropped his plan after having completed the lives of only ten of these exemplars of constancy seems to Professor Goddard intended as a "delicious" joke on women—no more were to be found! A first-rate illustration, we should say, of driving a theory to death.

The most interesting part, however, of Professor Goddard's article is his discussion of the much-vexed question as to the priority of the two versions of the Prologue to the "Legend of Good Women." He is right, we believe, in concluding that the A version was the earlier. We agree with him entirely, when he says: "Excellent, when taken by itself, as the A Prologue indubitably seems, the B Prologue is so immeasurably superior that the A version in comparison looks like the mere crude sketch of a prentice hand"; and again, when he says: "It is precisely in its structural qualities, in compactness and unity, that the B version is strikingly superior to A." There is, indeed, a radiance and energy about the B version that is absent from the other, and that is due even more to its structural superiority than to the superiority of phrasing which is also manifest at every point. At the same time, we are unable to concur with Professor Goddard in the explanations which he offers of the most important changes in the B version. For instance, it seems a counsel of despair when he interprets the substitution of "My lady cometh" for "Alceste is here" in the refrain of the ballad, as a joke played by the poet on Cupid to confuse the latter over the identity of Alceste and "My Lady." It is much more likely that Cupid, being not very particular, as the whole passage shows, as to the accusations which he rakes up against the poet, wilfully misunderstands the identity of "My lady." On any other theory, the difficulties of the ballad passage seem to us equally great, whether we take A or B as the earlier version. The astonishing thing is that Chaucer should at any time have left in his work such a flagrant inconsistency as this otherwise fine B version appears to offer. It may be said that he first committed the blunder and then corrected it in A, but he is just as likely to have introduced this contradiction while transferring the ballad from the attendants of Alceste (in A) to himself (in B) for the sake of certain advantages, viz., that it suits better in the mouth of a man than of women and strengthens, moreover, Chaucer's self-exculpation, while the change in the refrain permits a dramatic suspense before the disclosure of Alceste's identity. As regards the long "book-passage" in A, ll. 254 ff., which is condensed to a few lines in B, Chaucer may well have thought that this minute enumeration of the misfortunes suffered by faithful women weakened the dramatic situation, owing to the delay which it causes, and was superfluous, besides, inasmuch as the stories themselves sufficiently illustrated this variety of misfortune. We do not ourselves share Professor Lowes's views as to the priority of B, but in any detailed discussion of the problem of the Prologue, the arguments which he has advanced from the relations of the two versions, respectively, to the Old French *Marguerite* poems require a closer refutation than Professor Goddard has attempted.

"The Revelation to the Monk of Evesham Abbey in the year of our Lord, 1196, concerning the places of Purgatory and Paradise," rendered into Modern English by Valerian Paget (The John McBride Co.), places more easily than heretofore within the reach of the general reader this well-known specimen of the vast vision literature of the middle ages, the chief importance of which to the modern world is that out of such soil sprang the "Divine Comedy" of Dante. Mr. Paget's rendering, based on Prof. Arber's reprint of the fifteenth century English version of the vision, reads smoothly and will doubtless satisfy the public to which it is addressed, but the preface shows a woful ignorance of mediæval literature and even of the history of the book itself. There is no indication that the work was originally written in Latin or that its author has been identified —practically with certainty—with Adam, Abbot of Eynsham, 1213-1228. It may be true that the "original MSS.," if thereby is meant the author's autograph, is "no longer extant," but mention should have been made of the fact that at least seven MSS. of the Latin original are in existence, and that this original, having been inserted besides, in somewhat abbreviated form, in various mediæval chronicles (Roger of Wendover, etc.), is accessible in more than one volume of the Rolls Series. It is not even correct to speak of the copy of the early print by William de Machlinia in the British Museum (which Professor Arber reprinted) as unique. In his "Westminster and London Printers" (1906) E. G. Duff mentions another. Most remarkably of all, however, Mr. Paget reminds the reader that this vision belongs to the same period as "the Morality Play, such as 'Everyman'"—which, of course, is a work of the early sixteenth century—presumably because William de Machlinia printed the English version about the year, 1482.

Dr. F. W. Groves Campbell's "Apollonius of Tyana" (New York: Mitchell Kennerley) is a Pateresque appreciation of the first-century sage and mystic revealed to us in the third-century biographical romance of Philostratus. Judged as such it must be pronounced successful in spite of a few exuberances of rhetoric. Avoiding all religious and philological controversy, and omitting the cruder supernaturalisms of his original, Dr. Campbell reproduces skilfully the impression which Philostratus's narrative might make upon a somewhat consciously sympathetic student of "varieties of religious experience." His purpose, as we learn from Ernest Oldmeadow's introduction, is to whet the reader's appetite for more, and so create a demand for a complete version of the "Life," the only one now extant in English being that published one hundred years ago by Edward Berwick. The breezy Introduction presents a readable résumé of the literature of the subject from Bishop Eusebius to Baur, Zeller, Newman, and Froude. Mr. Oldmeadow seems to have overlooked that curiosity of literature, Treadwell's "Apollonius of Tyana," the most entertaining collection of misprints and *quiproquos* that America has yet produced.

Van Manen used to complain that no serious efforts had been made to defend the Pauline authorship of Romans. Dr. Robert Scott of Bombay ("The Pauline Epistles," imported by Charles Scribner's Sons) pays no attention to this complaint, but quietly assumes the Pauline authorship of the greater part of the four major epistles and of Philippians. This assumed, he proceeds on the evidence of language and ideas to assign the remaining letters canonically accepted as Pauline to Silas, Timothy, and Luke. Without going into the details of the assignment, we note that he makes Silas the author of Romans xi, xiii, and xv, Timothy of Romans xiv, and Luke of Romans xvi, 25-27, and of the Pastorals. Dr. Scott is not of those who frankly hold that of two hypotheses in the field of New Testament criticism the more far-fetched is the truer, nor does he write to the end that he may be quoted by his successors as the setter forth of strange opinions. On the contrary, he writes with insight and ability, and he desires to be taken seriously. But

in order that his results may be taken seriously, it would seem imperative that he should state with distinctness the canons of criticism in accordance with which he accepts as Pauline so much as he does.

The second volume of "The New Schaff-Herzog Encyclopædia of Religious Knowledge," edited by Dr. Samuel Macauley Jackson, assisted by Charles Colebrook Sherman and George William Gilmore (Funk & Wagnalls Co.), includes some 1,100 topics between the titles "Basilica" and "Chambers." Noteworthy articles are "Babylonia," by Mr. Gilmore, the editor, who furnishes the bibliographies, which are exceptionally complete and valuable; "Bible Texts," a long, careful discussion, the New Testament portion of which is unsigned; "Bible Versions," largely by Prof. Christof Nestle of Würtemberg; "Canon of Scripture," by Prof. Theodore Zahn; "Celtic Church in Britain and Ireland," a clear, succinct presentation of an obscure topic by Dr. Heinrich Zimmer of Berlin; and an able archæological study, "Cemeteries," by Prof. Friedberg of Leipzig. In church history and ecclesiastical biography the excellence of Hauck's "Realencykiopädle," on which the work is founded, is maintained. The articles on modern and living theologians, both scholars and preachers, will be found useful. Not so high praise can be accorded to the treatment of biblical and doctrinal subjects. The encyclopædia is frankly Protestant, but the endeavor is made to remain non-partisan between the various churches of Protestantism, and between different schools of Protestant thought. This is as it should be, since a work of reference is for information, not for argument or for prophecy. One may protest, therefore, at the statement of Dr. Benjamin B. Warfield in his article on "Calvinism," that "it may be contended that the future as the past of Christianity itself is bound up with the fortunes of Calvinism."

The religious ideas of Philo, especially in relation to Christianity, form the subject of the scholarly investigation of Hans Windisch, in "Die Frömmigkeit Philos und ihre Bedeutung für das Christentum; Eine religionsgeschichtliche Studie" (Leipzig: Hinrichs).

Students of Balkan affairs who do not read Italian, but would like a fresh glimpse at the valleys, mountains, and plains of Croatia, Herzegovina, and the neighboring countries, will find good reading in Gino Bertolini's account of an automobile and foot trip, translated by M. Rumbauer, in "Balkan-Bilder: Eine Studien-Reise durch den Hexenkessel von Europa" (Leipzig: Theodor Weicher), a handy volume with some seventy-five engravings from photographs, and a couple of maps.

Jacob Solomon, a lawyer and editor, died in New York, May 26, at the age of seventy-one. Twenty-seven years ago he founded the *Hebrew Standard*, of which he was editor up to the time of his death. He was active in Masonic circles, having been past grand senior deacon of the Grand Lodge, and he founded the True Craftsman's Lodge in 1867.

The death is announced at St. Andrew's of H. C. S. Everard, a golfer and writer on golf. He was the author of "The Theory and Practice of Golf" and a "History of the Royal and Ancient Golf Club."

From Honolulu comes the report of the death of Starr Hoyt Nichols, at the age of seventy-four. After graduating from Yale in 1854 he entered the ministry, but changed to the brokerage business in New York, and in later years devoted himself to literature. He wrote "Monte Rosa, the Epic of an Alp" and "The Breath of the World."

From Zurich comes the report of the death of Hans Nydegger, the author of a number of stories, chiefly in the Swiss dialect.

Hermann Osthoff, professor of Indo-Germanic philology and Sanskrit at the University of Heidelberg, has died at the age of sixty-two. He published a number of books, among which may be named: "Zur Geschichte des Perfects im Indogermanischen," "Die neueste Sprachforschung und die Erklärung des indogermanischen Ablautes," "Morphologische Untersuchungen," and "Etymologische Parerga."

AN ENGLISH STATESMAN.

George Canning and His Friends. Containing hitherto unpublished letters, jeux d'esprit, etc. Edited by Capt. Josceline Bagot. 2 vols. New York: E. P. Dutton & Co. $9 net.

No adequate biography of Canning has yet been written. Stapleton's memoir appeared within three years after his death—too soon. There have been other studies of this statesman, many appreciations of him, but the full and final survey of the man remains to be taken. The editor of these volumes does not pretend to take it. What he gives us is confessedly letters *pour servir*. He has had the first access to a mass of Canning's private correspondence, to which he has added some letters already published; and these, together with many letters to and from Canning's friends—Sneyd, Hookham Frere, Charles Ellis, Bagot, and others—all edited with minute and pious pains, make up the bill of fare.

It contains many toothsome morsels. There is here no connected account of Canning's career, much less of the stormy political movements of his day, but the running comment of this correspondence, most of it undress, and some of it highly confidential, is as amusing to the general reader as it is instructive to the historical student. From the earliest pages we find the youthful Canning revealing the chief qualities which marked his maturity. His wit, his impetuosity, his talent for making friends and, *more Hibernico*, his greater talent for making enemies, were as conspicuous in the Canning of 1790 as in the Canning of 1827. "Of all the public men," wrote Lyttleton of him in 1816, "that have appeared in our time, there is assuredly not one that ever had so many bitter enemies, public and private." This was partly the sundering nature of the politics of the day. What rent Fox and Burke apart, could not spare lesser men. Party differences were of a violence rarely seen since; and Canning was a strong partisan, long on the unpopular side. He fought his public battles, too, with Celtic vehemence, sparing no opponent when he had a chance to strike home. When Castlereagh challenged him to a duel, in a long letter of which the sting lay in the tail, Canning merely glanced at the peremptory summons, and exclaimed with an oath: "I had rather fight than read it." At the encounter, he got a bullet in the thigh, but a few days later a friend wrote that he "already jokes upon his wound." Such a combination of virulence and high spirits is nicely fitted to make a public man hated as well as loved. And to it all Canning added the fatal gift of ready wit, with a turn for epigram and an unsilenceable tongue. His flippancy often had a stiletto hidden in it. And as political prudence was unable to restrain him, so good taste did not always ride him on the curb—witness his phrase about "the revered and ruptured Ogden," which was as execrable on private as on public grounds. But *telle est la nature des Irlandais.*

The revulsion which the French Revolution provoked in Canning was like that it caused in Burke; but the literary effects were very different in the two men. Burke was driven into his tremendous invective, gloomy and almost frantic, though surcharged with eloquence and a kind of inspired philosophy of politics. But the other Irishman, Canning, undertook to raise a laugh at the expense of the demi-gods of France and their English admirers. This was something well-nigh unparalleled in the history of political satire. As a rule, it is the conservatives, the big-wigs, the *beati possidentes*, who are held up to ridicule. But Canning and his co-jesters of the *Anti-Jacobin* set out to make a joke of the radicals, to lampoon the heroes of the rights of man, to pour sarcasm upon the sacred heads of the champions of the people. The thing was done with infinite zest, with great learning and inventiveness, and with wonderfully sustained freshness and point; so that one can easily believe the effect of it all to have been considerable. Besides being a nearly unique literary phenomenon, the *Anti-Jacobin* was a political power, and played its part in the reaction which swung England from Whig to Tory, broke the heart of Fox, and made the rule of Pitt practically absolute.

To the political fortunes of the latter, Canning tied himself up; and it was as inheritor and continuer of the Pitt tradition in international affairs that he scored his first great success as Foreign Minister—the seizure of the Danish fleet. There was no clear justification for this in the law of nations, but it blocked the plans of Napoleon and filled him with furious rage, and what

more would you have? The expedition to the Low Countries which Canning counted upon to give him equal fame, turned out badly; but he gave due support to Wellington in Portugal and Spain, at a time when few Englishmen had the prescience to see what a stab in the back Napoleon was to get from that quarter. On all these great events, this correspondence throws little new light. The private and official letters of the Foreign Minister were too intent on the thing in hand to have time to explain the large bearings or the political philosophy of all. Throughout, one gets an impression that Canning was terribly driven by the public business—as, indeed, he was—with little margin left for the old practical jokes and overflow of fancy. One of his oldest friends and most faithful correspondents, was Sir Charles Bagot, the first British Minister to be in Washington, after the war of 1812, and later representing England in St. Petersburg and at The Hague. To him, Canning the Foreign Minister maintained a tone of friendly affection, even in official communications, though when once the Minister disregarded the instructions of his chief, he got a rebuke as stern as if no personal ties bound the two men. Yet the communication from the Foreign Office was promptly followed by a private letter, in which Canning wrote to Bagot:

> I was sorry to have to *snub* or *snouch* you, in your old age (the old age of your embassy), for disobedience of your instructions; but that disobedience . . . might have done a world of mischief.

The old Tory peer who, when Addington was Prime Minister, congratulated himself on the fact that "at last they had got a Government without any of those d——d men of genius," must have had a hard time of it when Canning was summoned to form a Ministry. The genius for eloquent and daring speech, as for large political combinations, was his; and it would not let the somnolent in England take their rest. Yet time has vindicated his most cherished policies. His resolute shunning of the Holy Alliance, and of European Congresses, bent on bringing the revolted Spanish colonies to heel, undoubtedly had the effect of calling into being a New World to redress the balance of the Old; and Canning's paternity of the Monroe Doctrine has further confirmatory proof in his letters of the time. On January 9, 1824, he wrote to Bagot of the President's "speech" (*i. e.*, message) that it was in agreement with his own dispatch of the March previous, though there were "important differences." One of them was Monroe's reference to the prohibiting of "further colonizations on the Continents of America." This was "as new to this Government as to that of France." However, Rush, the American Minister, assured him that his impression was that this part of the Monroe Doctrine was "principally, if not specially, directed against the no less extravagant doctrine of the Russian Ukase of 1821. Where one Power proclaims as a *Mare Clausum* an ocean of 4,000 miles across, the other may have thought it a fair set-off to prohibit colonization over the whole coasts of the Continent, with a view to which the *Mare Clausum* was attempted to be established."

Canning's most famous foreign dispatch is his rhyming one to Bagot: "In matters of commerce the fault of the Dutch." It has as long been misprinted as misunderstood. One historian speaks of Canning as "incorrigible," for venturing to bewilder his agent abroad in a time of "acute crisis." Another condemns, by implication, the Minister's readiness "to introduce a piece of drollery into the most serious affairs." But from the full correspondence, now first published—it appears that the serious affairs were attended to seriously. A formal and grave dispatch was sent to Bagot. Then, having got that off his mind, it occurred to Canning's playful wit to get a rise out of his friend at The Hague. So his rhymes were put into cipher and sent along, care being taken to use a cipher not in possession of Bagot. He at once applied for it, only to find that Canning had, for his puzzlement, sent him the same instructions in humorous verse that he had given in sober prose. In the formal dispatch the order was to impose "an additional duty of 20 per cent. upon Netherlands vessels and merchandise." This became, in the doubly ciphered rhyme: "So we clap on Dutch bottoms just 20 per cent." When the truth finally got into Bagot's head, he wrote back:

> You have fretted me to fiddlestrings, and I have a great mind not to give you the satisfaction of ever knowing how completely your mystification of me has succeeded. . . . I could have slain you! But I got some fun myself, for I afterwards put the fair de-cipher into Douglas's hands, who read it twice without moving a muscle, or to this hour discovering that it was not prose, and returned it to me declaring that it was "oddly worded," but he had always had a feeling that the dispatch must relate to discriminating duties.

CURRENT FICTION.

The Hand-Made Gentleman. By Irving Bacheller. New York: Harper & Bros.

This story has something approaching the free panoramic effect of "Huckleberry Finn." In the earlier chapters, at least, with their boyish adventure, the resemblance is striking. "Cricket's" flight from home under a cloud, and his first experiences thereafter, remind one strongly of the genial Finn and his exploits. Cricket's feat of crossing Niagara on the back of a wire-stepper fairly out-Hucks the earlier adventurer. But from that point the story loses its refreshing casualness, and proceeds by steady march toward a perceptible end which is not unlike the end of other novels. This is perhaps only to say that Mr. Bacheller is more of a novelist than Mr. Clemens. His humor is as genuine, though with a leaning toward sentiment, and the flavor of his people and his scenes is as truly of the soil as Mr. Clemens's or Mr. De Morgan's. It is delightful to find an American novelist now and then who can picture American types without self-consciousness; as if to say that the Lord might have actually made them to be regarded as finished beings, and not merely as tentative studies which we admit do not quite succeed in being this, or which we assure you do succeed in being that.

The "hand-made gentleman" himself is, to be sure, highly self-conscious: a wooden-legged peddler bent upon making himself a gentleman and a millionaire. It is not the desire of the moth for the star, the hopeless struggle of the peasant to become the prince; for with us there is no such forlorn hope. The peddler succeeds. He is, however, rather the least interesting person in the story. Nor are the counterfeit presentments of old Vanderbilt and Mr. Carnegie, exciting as it is to meet "real people" in fiction, the best that Mr. Bacheller has to offer. Into their company, no doubt, the hand-made gentleman's "Sal" (a "Tono-Bungay" of housewifery) brings us not too obviously by the ears. But the commercial anecdotes related in connection with the celebrities are good newspaper or magazine material, nothing more. The person of whom we do not hear enough, the real hero of the story in no canting sense, is "Pearl." The presence of this gentle, philosophical, unapplauded figure in the background offers its unspoken ironical commentary on what would otherwise seem to be the too-familiar moral of the book. Old Pearl is far greater in heart and soul than the hand-made gentleman, infinitely greater in mind. But he is just a failure: he just does not win the woman he loves, his important inventions are just anticipated by others. He becomes a protégé of the hand-made gentleman, and takes his wage without bitterness; a noble figure drawn without a stroke of false sentiment.

The House with No Address. By E. Nesbit. New York: Doubleday, Page & Co.

The author of "The Incomplete Amorist" and "The Wouldbegoods" does not know how to be dull, and presumably would make little use of her knowledge if she did. The present story is of a rather nondescript sort—a cross of romantic idyl and tale of horror. The beginning is idyllic, and the transition to the gruesome pretty violent. A lovely and lonely English girl of a not uncom-

mon type becomes almost the prey of a designing fiddler. In due time she meets the man she can really love. The villain tries to make profit out of the situation; but on the eve of the marriage of the lovers it transpires that the villain has been murdered, and the girl twice (the second time knowingly) makes use of the dead man's head in her Salome dance in a London music hall. If by this time the whole affair did not strike one as artificial, a mere experiment in the vein macabre, the episode would be intolerable. To confound our confusion, the lover, who has hitherto seemed a decent chap, turns poltroon, and another has to be trumped up at short notice to fill out the heroic bill. In the succession of events no ingenuity is spared to put everybody at cross-purposes with everybody else, and in the end the girl gets the right man. A sufficiently lively essay, it will be seen, in the latest style of the blood-and-thunder romance. The author affects a familiar and rather facetious manner, and does not hesitate to let drive an apothegm now and then on her own account—most characteristic, perhaps, being the repeated assurance that "life is a rum thing." The proofs of this book have been very carelessly read.

"This My Son" (Les Noellets) By René Bazin. Translated by Dr. A. S. Rappoport. New York: Charles Scribner's Sons.

This is a sombre rather than tragic tale of French peasant life. The translation reflects the simplicity and charm of the French original—a flavor rarely so well caught by an alien hand. The Noellets are a family of small proprietors, farmers in their own right, who have for generations toiled and planned in the Vendée. The father of the present Noellet has at last found it possible to invest their accumulated savings in the purchase of a farm which the impoverishment of a noble family has placed in the market. The present Noellet represents a culmination of the powers and ambitions of the race: a sturdy and tireless son of the soil, to whom a good harvest, a good appetite, and a steady surplus at the end of the year are the supreme benefits to be offered by life. To him are born two sons, the elder his physical counterpart, without love for the soil, but with strong intellectual and social ambitions. The younger inherits the ancestral character, but a comparatively feeble physique. In order to escape from farm life and win the education he covets, the elder pretends a wish to become a priest. When at the end of five years he tells his parents that he cannot enter the church, they are heart-broken, and in the end he is cast off by the father, who resents implacably the double treachery to himself and to the soil. This is but the beginning of the havoc wrought by the son's egotism. Study has so injured his eyes as to release him from military service, and his brother, in most respects his physical inferior, qualifies in his place, to be quickly broken down by the routine of the barracks. The elder son's ambition results only in his becoming a minor Parisian journalist, and his hope of marriage above his class is rudely frustrated. His death at the door of the country girl who has hopelessly but faithfully loved him rids society of a useless mongrel. It is plainly a story with a moral—the moral of fidelity to ancestry and to class; but it has none of the tediousness of the sugar-coated tract, nor has it the melodramatic obviousness which is perhaps suggested by a bald rehearsal of its incidents.

John Silence. By Algernon Blackwood. Boston: John W. Luce & Co.

It is not strange that these weird tales of a "Psychic Doctor" should issue from that hotbed of the occult, Boston. They are a fine growth, if somewhat forced at times. They include stories of witchcraft, devil-worship, and the origin and end of a werewolf; distinctly the most impressive of the volume, however, is "The Nemesis of Fire," which has a touch of that peculiarly gruesome and haunting quality that made "The Turn of the Screw" a thing to shudder at in broad daylight. A mummy which had been placed at the time of its entombment under the protection of a Fire-Elemental, is stolen from its tomb and buried in the grounds of an English country-house, after being despoiled of its sacred scarabæus to make a brooch for the sister of the man who originally disturbed its rest. The revenge of the unseen custodian upon the desecrators of the ancient dead, culminating in the sister's return of the stolen treasure, too late to save herself from the fiery doom, is a story not easily forgotten. John Silence is a sort of spiritual Sherlock Holmes, a novel contribution to the gallery of autocratic specialists in various lines who tower in the pages of modern fiction. Truly there are giants on the bookstalls in these days; it may be human nature's defiance of the increasing stress laid upon the assertion that all men are created equal.

The Shores of the Adriatic: The Austrian Side; the Küstenlande, Istria, and Dalmatia. By F. Hamilton Jackson. New York: E. P. Dutton & Co. $6 net.

Dalmatia, the southernmost crownland of Cisleithan Austria, is beginning to unfold its charms to increasing numbers of tourists. In 1875 Freeman could still write:

> Given such weather as suits fair-weather sailors, there can hardly be any enjoyment more thoroughly unmixed than a sail along the coasts of Dalmatia. First of all, there is a freshness about everything. Here is a portion of land which is thoroughly unhackneyed; the coasts, the islands, the channels of Dalmatia are as yet uninvaded by the British tourist. No Cook's ticket can be taken for Spalato, no hotel coupon would be of the slightest use at Sebenico.

To-day the Austrian Lloyd maintains a regular steamer service between Trieste and the towns of Dalmatia, and Cook's tickets for any of them may be purchased in New York, as well as in London. It cannot be said, however, that the manufacture of good guide-books to that enchanted region has kept pace with the awakening interest in it. In spite of such recent publications as Maude M. Holbach's agreeable, if superficial, "Dalmatia, the Land Where East Meets West," Freeman's complaint almost literally holds good to-day: "The best guide to those parts is still the account written by the Emperor Constantine Porphyrogenitus more than nine hundred years back." The English reader may indeed gather from Freeman's own discursive "Sketches from the Subject and Neighbour Lands of Venice" much valuable historical information, and from Sir J. Gardner Wilkinson's authoritative "Dalmatia and Montenegro," published sixty years ago, a painstaking account of those features of the daily life of the races of the Eastern shore of the Adriatic which Freeman so consistently ignored; while T. G. Jackson's classic work, "Dalmatia, the Quarnero and Istria (1887)," remains the best English account of the architectural and archæological treasures of the towns of which it treats. Thanks, moreover, to the fact that every Dalmatian town boasts some learned antiquary willing to place his local lore at the disposal of foreign students, there exist many treatises on single topics relating to Dalmatia, such as Villari's admirable "The Republic of Ragusa," but nevertheless the average English or American tourist must still turn for general information concerning a trip through Dalmatia to the meagre pages of Baedeker or Murray.

Nothing in the title of F. Hamilton Jackson's "Shores of the Adriatic" indicates that the author appeals to but a limited public. It is a companion volume to his work on the Italian side of the Adriatic and, like it, is chiefly concerned with the architectural and decorative aspects of his subject. He acknowledges his indebtedness to Jackson's "Dalmatia," and he has drawn on many Italian, French, and German authorities (the titles of the works of the last-named are not always correctly spelled). The thread of personal narrative is barely discernible in the mass of tediously minute historical detail which alternates with the plans of basilicas and the enumeration of the mosaics, embroideries, chalices, croziers,

monstrances, plate, and vestments enshrined within the cathedrals. Paintings and statuary, it is true, are by no means neglected, but it is characteristic of the author's point of view that the list of "craftsmen" in the index includes Bellini, Carpaccio, Palma Vecchio, Paolo Veronese, Pordenone, Sansovino, Tintoretto, and Titian. Nor is any critical attempt made to set the reader right as to the authenticity of the Titians to be found at Verbosca and Ragusa. Of more general interest are the descriptions of the Morlaks, the picturesque Slavic inhabitants of Istria and Dalmatia, but their marriage and religious customs, their folk-lore, proverbs, music, and song, their amusements, superstitions, and vendettas might, with profit to the book, have claimed more space than the author has assigned them. Nor, in general, can it be said that he has set forth a tithe of the charms possessed by a region which bears the impress of a history of two thousand years, during which Illyrians, Romans, Goths, Byzantines, Normans, Venetians, Croats, Serbs, Hungarians, Turks, and Austrians struggled for possession. Mr. Jackson, like so many of his predecessors, does indeed full justice to the architectural splendor of Dalmatia's past; he sings the praises of Diocletian's palace at Spalato, of the palace of the rectors of the republic at Ragusa, as well as of the cathedral of Sebenico, which has been termed "one of the noblest, most striking, most simple, most Christian of all churches"; but Dalmatia, the land of wonderful fjords and noble harbors, of lovely islands famed in literature and naval warfare, of proud, sea-girt cities on frowning cliffs concealing a primitive hinterland; the country which bears everywhere the image of the winged lion of Venice, but is destined to witness ere long the disappearance of Italian speech as the culmination of the struggle between its Italian and Slavic elements—this Dalmatia is still to be adequately described.

Pictorially, Mr. Jackson's volume is rather attractive. One of the most striking of the full-page photographs exhibits a group of Albanian horse-dealers at Cattaro, whose countenances do not belie the reputation for ferocity enjoyed by these untamed sons of ancient Illyria.

William Godwin und Mary Wollstonecraft. Von Helene Simon. Munich: C. H. Beck'sche Verlagsbuchhandlung.

Seldom may the author of a work, stamped with the thorough spirit of a model Doctorate *Arbeit*, be congratulated on its literary finish and mechanical and artistic production, as in the case of this first combined biography of these two distinguished and much misunderstood reformers. The wonder is that no one before this German author, especially that no English writer, has felt the exceptional attraction of their lives and works as something intricately associated together. Separated too early by the untimely death of Mary Wollstonecraft, honored long as separate personalities —as in the National Portrait Gallery, where each has a place, but in widely distinct classifications—they have too often been dissociated by historian and critic, and their aims have been misinterpreted. Godwin especially, according to Helene Simon, has been wrongly or inadequately characterized. Thus, Karl Diehl, in 1890, aided by Kegan Paul's edition of Godwin's Letters and Journals, recognized in Godwin the founder of the anarchist theory, and to this place Miss Simon assigns him; but Kropotkin, although he also lived in England, and Richard Stammler maintained that Proudhon was the father of anarchy. Pierre Ramus and Walter Borgius, on the other hand, would make of Godwin the "theorist of communistic anarchy," while Anton Menger finds in him not only anarchy, but Socialism, and calls him "the first scientific socialist of modern times." Miss Simon seeks to rescue Godwin from this unholy mixture of anarchy, communism, and Socialism, and insists that his true title is the founder of individualistic or pure anarchy. In this respect, Godwin was quite unlike such reforming contemporaries as Owen, for he reached directly no practical goal. He was, as biographer, historian, novelist, and dramatist, a "revolutionist of heads," and a scatterer of seed among other minds.

As to Mary Wollstonecraft, although she died when only thirty-eight, she is without doubt the first notable leader in the movement for greater freedom for women; but she was more than an agitator for political rights and her goal was greater than that of the French upheaval, which also mightily stirred her soul. She sought to ennoble the conception of motherhood, to awaken a greater sense of responsibility among women, and to elevate their position primarily as human beings rather than as mere women; and so the most of her writings have a pedagogical value for the generation of to-day, and a nobler spirit than that which characterizes the polemics of most twentieth-century agitators. Both Godwin and Mary Wollstonecraft were misunderstood in their theories of marriage. Both, according to Miss Simon, strove to elevate the relation of the sexes; and if they erred, it was not through youthful carelessness, but a deep conviction that what they did was right.

The author reviews with care the various steps in the development of both her hero and her heroine, individually and when striving together, and analyzes their respective works, giving, as a welcome aid, an exceptionally good bibliography. Among the most interesting and touching chapters is that which pictures the death of Mary, the despair of William, and the runaway match, after the mother's death, and bitter hours of later repentance of their sixteen-year-old daughter Mary with the poet Shelley. Three portraits, two of Mary Wollstonecraft and one of Godwin, after the paintings in the National Portrait Gallery, add much to the attractiveness of this memorial.

Science.

RAIL MOTOR CARS.

The receiver of the Third Avenue road in New York has ordered an experimental gasolene-electric street-railway car for use where the track conduit is impracticable. This action brings up again the question whether it is possible to design a rail motor car, with power entirely self-contained, which will be able to compete effectively with some of the existing means of transportation.

Railway managers have long known that there are some kinds of service for which the steam train is not economical. The smallest locomotive it is practicable to build under present conditions of design can haul three or four cars just as well as it can haul one; yet there is an enormous amount of branch-line mileage where one passenger car can handle all the business. Moreover, if a single passenger car is adapted to a small steam locomotive, it yet requires a train crew of three, since neither the engineer, the fireman, nor the conductor can be dispensed with. Thousands of miles of branch-lines are traversed every day by passenger trains which do not earn their operating expenses. Yet they must be run to accommodate the public, and to aid in developing territory.

To solve this branch-line problem, many experiments have been tried with rail motor cars. Certain English railway managers took the matter up about six years ago, and built small steam motors as fast as the shops could turn them out. The success of the gasolene road motor car has induced experiments with gasolene rail motor cars in many countries; but they have not been very successful, principally because they were much heavier than the ordinary automobile, so that their inertia worked against the mechanical principle of a motor driven by a series of explosions; while there was always apt to be trouble with the gears. As a result, gasolene rail motor cars show excellent running economies when in good working order, but are burdened with more than offsetting shop and repair costs. So far as we know, but one type of this car is in successful commercial use in America. The question really turns on

the efficient life of the machinery, and to determine this scarcely enough time has elapsed. Yet the Union Pacific has great faith in the experiment; it owned sixteen of these cars at the time of its last annual report, and has been increasing the number rapidly.

There have been two important reports on the general subject of rail motor cars; one by the Rock Island Motive Power Committee in 1904, the other by a special committee appointed in 1907 by the general manager of the Pennsylvania Railroad to visit Europe and examine the whole question. The Rock Island committee pointed out the important operating economies to be had by using single motor cars in the place of trains; it listed the three general types in use, and expressed its opinion that a steam-driven composite car was the best solution of the problem. Yet the company has not been very active in following out the report of its own committee, although it has recently completed an experimental steam motor car.

The report of the Pennsylvania committee, on the other hand, brought out the fact that the managements of the British railways show no enthusiasm over the working of their steam motor cars, although in 1907 the Great Western had 84 of these machines operating on 44 lines. English railways are compelled to provide fully equipped stations at all regular stops of their steam trains, together with a complete staff of attendants; but in the operation of rail motor cars they are permitted to establish stops called "halts," without any accommodations or conveniences for passengers except a low platform. Here is a legal, rather than a mechanical, reason why these cars may be profitable in England. The Pennsylvania committee found that steam motor cars were successful in Germany, although all rail motor cars were considered experimental. Tests have been made in Italy and France with steam motor cars, but the results are not conclusive.

In two countries—England and Germany—gasolene-electric cars have been tried, with indifferent success. Yet the gasolene-electric car, in which the gas engine impersonates a miniature powerhouse, while the electric equipment turns the wheels under the car, has certain mechanical advantages arising from the absence of the gear problem and from the fact that electricity, not being explosive in its action, picks up the inertia of a stationary car more patiently and with less general rack and wear than does gasolene. The difficulty with these cars has been their complexity and costliness, both to build and to maintain, while their working results have been irregular.

With five nations engaged, and with fair results already achieved, it may be assumed that the problem will be solved sooner or later. Besides the economy of branch-line working, rail motor cars can perform an important service on main lines in picking up passengers at express stations after the passage of the fast train and distributing them at small cost to local stations; while, by a reversal of this process, the express stations are filled with passengers in advance of the through train. On street railways, they can be run without the abomination of the overhead trolley, and also in localities where the underground conduit is impracticable. As soon as rail-motor cars can be built and operated economically, they will give a new prospect of convenient and efficient transportation.

The Face of the Earth. (Das Antlitz der Erde.) By Edward Suess. Translated by Hertha B. C. Sollas, under the direction of W. J. Sollas. Vol. III; pp. viii-400, pl. i-vii, fig. 1-23. New York: Henry Frowde. $5.75

This translation of Edward Suess's great physiographic classic places at the command of English-speaking readers and students a mass of recorded fact and discussion not elsewhere accessible. In the preceding volumes the movements of the earth's crust, the mountain ranges of the earth, and the abysses of the sea had been described. In the third volume the "face of the earth" is especially treated, the aim of the author being to detect and emphasize the great structural features. Folding is recognized to be universal, if we draw no distinctions as regards geologic time. We may then look for underlying systems in the axial trends and arrangements of the elevations. The method of attack is to pass the large continental areas in review. The present volume is chiefly occupied with Asia; only toward the close is Europe reached. The other continents remain for future treatment.

Two great structural features are brought out in especial relief, a vertex from which mountain systems radiate, and an arc which characterizes the curving course of the lines of elevation. For Asia, and to a certain extent for Europe, these are traced with much success, but whether the convex curve can be universally found is a constant question which arises in the reader's mind. Nevertheless, on the perusal of this volume, as in the reading of the previous volumes, one is profoundly impressed with the range and accuracy of the venerable author's reading. He sums up into one connected whole the many little-known ranges of Asia and the better-described and studied chains of Europe, so that a large number of scientific observations and much recorded knowledge are now easily available, which before were scattered and almost inaccessible.

The translation has been acceptably and accurately done. Revisional assistance has been given, as a felicitous token of respect to Professor Suess, by the most eminent of the English and Australian geologists.

The *Annales de Géographie* for May contains articles descriptive of regions in Algeria and French West Africa, and also of a chart of Mt. Blanc, which is interesting as being "the first geometric representation on a grand scale of a French mountain mass." Charts of the whole chain of French Alps to Nice, twenty-two in number, are in preparation. There is also a summary of hydrological and meteorological observations in some Norwegian fiords, taken by a French naval vessel, the Bougainville. The editor, L. Gallois, contributes an historical sketch of the part which the Academy of Sciences took from its foundation in 1666 by Colbert in securing a large topographical map of France.

Dr. Heinrich von Ranke, nephew of the historian and himself a distinguished physician, has died at Munich in his eightieth year. He was appointed professor in the University of Munich in 1874, and wrote largely for the magazines on topics of medicine and archæology.

Giovauni Vailati, a native of Crema, Lombardy, and a frequent contributor to both Italian and foreign periodicals, including American journals of mathematics and philosophy, died in Rome, May 14, at the age of forty-six. After graduating from the University of Turin he served for several years on the staff of its mathematical department, and afterwards taught in the Istituto Tecnico at Florence. Appointed a member of the Royal Commission for the Reform of Secondary Education, he had devoted his time during the past three years chiefly to problems of school organization and pedagogy.

Drama and Music.

"Little Eyolf" and "A Doll's House" have been published by John W. Luce & Co., Boston and London, in a new edition to be known as The Players' Ibsen, newly translated into English from the definitive Dano-Norwegian text, and edited, with introductions and notes, by Henry L. Mencken. Each play is well printed, in clear, black type, in a little pocket volume, attractive in appearance and convenient for transportation. The editorial matter—which has the merit of brevity—and the notes contain useful information for the general reader, but are less trustworthy in their critical opinions than in their statements of fact. Not every student of Ibsen will subscribe to all the estimates placed upon his genius or his influence. In the translation great pains have been taken not only to follow the exact phraseology of the original, but also to reproduce, so far as possible, the more delicate shades of verbal meaning by which Ibsen sought to throw light upon the characters of his personages. To what extent this has been accomplished could only be determined by a close comparison with the original, which

is scarcely necessary at this time. As a matter of fact, a perfect translation is impossible. The spirit and genius of one language cannot be transferred, in bulk, to another. This is particularly true in the case of poetry, and all who wish to appreciate Ibsen justly as a poet must learn his native tongue. But there is no good reason for supposing that his prose works have lost much in the process of their conversion into English. On the contrary, it is generally admitted that he has been particularly happy in his translators. The text of this latest version of "Little Eyolf" does not differ greatly from that of Mr. William Archer, and the changes in it, where they do occur, do not always commend themselves; for speaking and acting purposes they are often less effective and less natural. But, after all, these changes are of no great importance, and the latest text is good enough for all practical purposes. Its one real superiority lies in the handy form in which it is offered.

Discussing a recent performance by the students of the Academy of Dramatic Art in London, a prominent critic writes:

It is expected—it might almost be said to be demanded—of the students of such an institution that they should know the grammar of their art; and they do so. They know how to speak, how to move, how to stand, and to stand still. But they know more than this—in some cases much more. Having mastered the grammar, they have been taught to turn their knowledge to artistic effect, for the expression of themselves through their parts.

From this it would appear that the institution founded by Beerbohm Tree some years ago, which includes many well-known actors in its corps of instructors, is really doing good work. The same thing could be said truthfully of the Academy in New York. Theoretically, a good school of acting ought to be just as effective as a repertory theatre in the manufacture of capable actors; but, actually, it is almost always handicapped by the lack of the proper raw material. As a general rule, young men and women possessing the histrionic instinct in any marked degree—although they would probably profit by a little wholesome instruction more than others having no ability of the kind—scorn the idea of school when they can earn a little money in some subordinate capacity, with the chance of working their way up. In the days of the old stock companies they secured a general education easily enough, but in recent years even the best actors have been confined to special lines. Now there seems to be some likelihood that the old school of acting may be restored.

William Devereux, author of "William of Navarre," is to write a play for Lewis Waller on the subject of Walter Raleigh. The interest will centre in the discovery of a plot to dethrone Elizabeth in favor of Queen Mary, and the courtship and marriage of the hero will be prominent features.

D'Annunzio has written a Punch and Judy act for Naples, called "Tares." But it will probably be given first in Milan, at the Manzoni Theatre, and a company has been especially engaged to appear in it. This play is to be translated into French for the Grand Guignol of Paris. D'Annunzio says that he never enjoyed himself more than he did while writing this little sketch.

Russian opera has been made a special feature of the Monte Carlo season by Raoul Gunsbourg, the enterprising manager. Glinka's "Life for the Czar" and Rubinstein's "Demon" were mounted by him in turn, and then came Dargomijsky's "Russalka." The composer of "Russalka," who died in 1869, may claim with Glinka the distinction of founding the school of "Young Russians" which has included in its ranks Balakirev, César Cui, Moussorgsky, Borodin, and Rimsky-Korsakoff. His music is little known outside of Russia, and the success which "Russalka"—originally performed in 1856—seems to have obtained at Monte Carlo is hardly likely to lead to its production elsewhere. Tchaikovsky, it is true, did not rate his compatriot's gifts very highly, but this does not mean much, seeing how perverse were the views he not infrequently expressed concerning the works of other composers, and that he was unfavorably disposed towards the circle to which Dargomijsky belonged.

The Chinese have programme music and had it long before we did. Consul-General Clarence E. Gauss at Shanghai has come upon pieces of music entitled "Opening the Hand," "The Maid of the Green Willow," "Mother Understands Me Well," "Alone at Home," "Dame Wang," "The Abode of Love," "The Widow's Lament," "Painting Fans," "Breaking the Looking-glass," "Making Verses with a Bird," "The Locust's Fate," "The Seal of Longevity," "The Ladder of Happiness," "The Happy Dream," "The Men Who Fear Their Wives," "The Crockery-mender." The consul also calls attention to the fact that Chinese music is divided into two classes, ritual and popular. Under the name of ritual music must be comprehended all music performed at court or at religious ceremonies. Under popular music are grouped all theatrical, ballad, professional, and ordinary street song music.

Dr. John W. Bischoff, the "blind organist of Washington," died in that city on Sunday. He had played the organ at the First Congregational Church in Washington for thirty-five years, and his annual concerts have long been musical events of prominence. He became blind when he was two years old. Among his many compositions were "Good Night, Sweet Dreams," "Unanswered," and "Bobolink."

Art.

THE TWO SALONS.

PARIS, May 18.

The chief impression made by the two Salons this year, as for several years past, is one of disappointment. There seems to remain not even a faint reëcho of the strong and healthy movement among artists that resulted in the new Salon twenty years ago, nor are there any signs of a new generation "knocking at the door." And yet, to come straight to the big annual exhibitions in Paris from the bazaar into which the Royal Academy in London has degenerated, is to be, as always, struck with their workmanlike aspect and atmosphere, as well as with the fact that in France art still has its uses, and the artist a chance to work for a more definite end than the catering to popular taste. There may not be a fortune for the French artist—as there is to-day for the American—in the commission of state or municipality, or other public bodies, but at least there is the opportunity from which many of the world's masterpieces have sprung.

At all events some of the most interesting, if not the most successful, work at the new Salon is to be found among the huge mural decorations, for it is one of the redeeming features of the poorest Salon that a place should always be made for them. The centre of honor in the room at the top of the stairway in the new Salon is this spring devoted to M. Ménard's series of enormous panels for the Faculté de Droit at Paris. To my knowledge, he has never before attempted anything on so vast a scale. His subjects are the same as in his smaller canvases—romantic landscapes, with ideal or mythical figures well subordinated to them. The great clouds piled up high in the heavens, the wooded hillsides, the tranquil pastures and solemn groves, the men and women in heroic nudity or graceful drapery tending their herds or wandering in peace, the horsemen who might have ridden straight out of the frieze of the Parthenon, are all arranged with the right feeling for their decorative value. They have the charm Ménard always brings to his poetic interpretation of nature. But mere size can add nothing to this charm; indeed, I am not sure that it does not take something away. Still, experiment will carry the artist further than perseverance in the old and easy grooves.

The methods and conventions of M. Aman-Jean, on the other hand, are adapted to decoration, no matter on what scale he works. He may go to nature for a motive, but never for models, and he finds a decorative formula even for his portraits. But languor of late has overtaken him, and he scarcely seems to have the vigor, or vitality, to cover so vast a space as his panel for the Musée des Arts Décoratifs. It has already the faded look of an old fresco. Comédie is his subject. You remember what Watteau would have made of it, and then you look to the pale, formal garden where strolling players move like shadows through a listless performance for the pleasure, apparently, of three wan, weary ladies who have hardly the strength left to follow it with their heavy eyes, and you are inclined to see in conception and execution alike only the affectations of the painter. But Aman-Jean understands as well as Puvis de Chavannes the appropriateness of a pale color-scheme to the decoration

of a wall of which it becomes a part; he understands, too, that the suggestion of action in the group arranged across his foreground would have destroyed the decorative illusion, and that a less artificial setting would not have yielded lines as rhythmical. Ménard's panels may be robust in comparison, but set up in place, Aman-Jean's will probably tell with more effect.

His decorative treatment certainly is more in keeping than the pictorial tendency of Gaston La Touche in his rendering of a somewhat similar subject, Théâtre de Verdure, which is intended as a decoration of a stairway for the Mercier Frères, but which is little more than a picture that might be hung up in its frame anywhere. The panel by M. Besnard to complete his decoration for the cupola in the Petit Palais, as you see it in the new Salon, with its large nude Venus the centre of a disjointed composition, seems coarse and without structural coherence. But few modern artists have had more experience in decoration than Besnard, and it may very likely be that in the cupola the coarseness will become refinement and the design take its place as a logical part in the larger scheme. The only other work of the kind that I found of interest was M. Boutet de Monvel's series of Projets for his decoration of the basilica at Dourémy. For his treatment of these three events in the career of Joan of Arc, he has borrowed the method of the old illuminator, working in pure brilliant color, with the most minute attention to every detail, in the gorgeous ceremonial as in the intricate ornament of priestly robes and knightly armor, and yet managing to produce a broad and harmonious effect, and to prove that the artist of to-day may go to the past for inspiration without ceasing to be modern.

In the old Salon, the big designs amount to little more than the yearly *machins* manufactured to create a sensation and, if possible, make a *réclame*. One of the best and most scholarly is M. Gervais's Garden of the Hesperides. But while, with an artist like Besnard, you feel that he is absorbed in the artistic problem no matter how successful or unsuccessful he may be in his way of solving it, with Gervais, though he too deals with classic legend, you cannot help suspecting that a more important end is the popular success, to be had at the Salon only by a louder and more sensational bid for it than anybody's else. And so, for him the Garden of Hesperides becomes a dazzling spectacle, violent in light, hot in color, filled with nude figures and flowers and many-hued beasts, and birds—a place to be avoided by the poet in search of peace and beauty. From this, you descend to lower depths of sensationalism, until you can go no deeper than a huge interior of Notre Dame painted in theatrical perspective and hung where it can tell almost as well as on the stage, and so catch the eye of all the gaping crowd.

A decorative motive runs through much of the smaller work at the new Salon, even through pictures not intended definitely for such an end. It still struggles with the pictorial motive in all La Touche's canvases, though his fantasies begin to border close upon anecdote. It is felt in the four small paintings by Mr. Frieseke, who in them has left the boudoir for the open air. He evokes such cool and pleasant harmonies from so simple a fact in nature as the falling and filtering of sunlight through green leaves upon shady green pools and streams, that I regret the more the failure, as I cannot but think it, of his Femme nue à la Toilette, a large nude realistic study of a not too refined model. But in this, as most always in his work, the detail is rendered with great delicacy. The responsibilities of realism never weigh heavily upon Mr. Morrice. Whether he paints the snow in Canada, the sea in Brittany, the quays in Paris, nature is never for him a problem of planes and atmosphere and light, but exists solely to suggest inexhaustible arrangements of color and line. Mr. Barlow is another who sees, or tries to see, in the life around him nothing save harmonious and rhythmical combinations, the tone always low, the feeling always tender, the charm rarely absent. Chanson Rose he, this year, calls one of his usual gray interiors with the group of quiet, simple figures, and the title is expressive of his aims and methods in all.

It is because comparatively few pictures appear to have given their painters any pleasure at all that they produce such an effect of general dulness. Take the portraits, for instance; only one or two, here and there, seem to have been anything better than a task to the weary artist. The most brilliant exceptions are M. Boldini's two of women, one of a man and his wife. Whatever may be thought of them, it is as impossible to deny the vivacity with which they are painted as the fact that they are the work of a master of his trade. They are exaggerated in pose and movement; in the impossibly elongated figures, in the tight-clinging draperies, in the exuberant elegance of silks and satins and furs, in their truth to, or rather caricature of, the fashions of the moment; but they are alive, enormously accomplished, with a technical vigor and dash that no other portrait painter to-day can approach. They seem the more startling because the year otherwise is not remarkable in portraiture. M. Blanch had an interesting sitter in Henry James, but has failed, or so I cannot help thinking, to grasp his character: had it not been for the name in the catalogue, the portrait to me would have been unrecognizable. Another chance for a strong study of character has been lost by Mr. MacCameron (old Salon), who shows us a very colorless President in his portrait of Mr. Taft. Indeed, our statesmen fare rather ill at the hands of their painters, Mr. Charles Joseph Bonaparte figuring with as little distinction, or semblance of individuality, on the canvas of Mme. Cécile de Wentworth.

Most of the older men—Carolus-Duran, Roll, La Gandara—are poorly represented. Even M. Caro-Delvaille has no portrait that can compare with his fine group of a few years ago, now in the Luxembourg, and is much more interesting in his study of the nude, Groupe Païen, which, however, is not pagan at all. The figures of the man and woman both are modern in type and treatment, though he seems to have been haunted by memories of Michelangelo and to have sought, by giving them heroic dignity, to escape the commonplace of the mere Salon nude to which he condescended in his picture of last spring. Zorn, Zuloaga, Sargent, are not represented. But it is a year of absences, and Louis Legrand and Anglada are also among the many who send nothing. Unfortunately, if the two Spaniards, Zuloaga and Anglada, who have made the success of modern Spanish art, do not show, the Spanish picture is bigger and more in evidence than ever—especially in the old Salon—so much in evidence that one passes quickly by even the most cleverly painted Spanish gypsy or Spanisb peasant, Spanish bull-fighter or Spanish dwarf. In the few years since Zuloaga first took the new Salon by storm, his imitators in new and old have already made a hackneyed story of his subjects.

Individuality counts even in a big exhibition, and the man who has something to say for himself triumphs in the end. This is why M. Veber seems to have lost nothing of his gayety. Besides, this year he has had the intelligence to refrain from decoration on a large scale and to return to the small canvas to which his little figures more appropriately belong. He has one or two of the tavern scenes that have won him the name of the "modern Breughel," but his caricature, his satire, rather, of the people of to-day is so cruel in its truth that he is really amusing only in his comic versions of old myths or fairy tales. M. Hochard also conquers by sheer force of personality, though neither his way of looking at things nor of presenting them qualifies him best for the illustration of Flaubert, which he now undertakes. Walter Gay, by the personal touch he gives to the little interiors he loves to paint; Jean Béraud, by sheer literalness in his realism, on as minute a scale, command more attention than the painters who sprawl,

with nothing of their own to say, over colossal expanses of canvas. But the picture that attracted me most by its originality, at least in selection of subject, was Jules Adler's Hauts Fourneaux at Charleroi, exhibited in the old Salon. Here is a painter who has had the eyes to see the picturesqueness, the romance of work, to discover the splendor of gaunt, unlovely factories and chimneys when transformed by the magic of the smoke-laden atmosphere. The canvas is large, and evidently the painter has not known what to do with his foreground; the color is leaden, and the smoke is heavy, but, with all its faults, the picture comes as an eloquent reminder that beauty exists in the modern world as in the ancient.

I say less of the landscapes because, excellent as many are, the landscape painters are so apt to fall into repetition, or mannerism, that one year's picture is very like a copy of last year's. This certainly is the case with M. Lhermitte, who better than anyone else can give the effects of afternoon light shining on the stream with its lines of washerwomen bending over the bank, or on the field where harvesters are at work; and with M. Billotte who, by sheer sympathy and the tenderness of his scheme of gray, can fill the waste lands of the squalid suburb with poetry; and, in the old Salon, with Point elin, whose heath never loses its gentle melancholy; and Harpignies, whose composition never loses in stateliness; and Gosselin, whose trees rise with slim unerring grace from the ever-green countryside. M. Le Sidaner, wherever he goes, to London or the French provincial town, to Venice or the Italian lakes, takes the same technique with him, until even the silent hours of the night lose their repose in the restlessness of his system of dots or touches of color. Now and then a new note is struck, by Charles Warren Eaton, in the old Salon, or by M. Pôpesco, a Rumanian, in the new. But, for the rest, there is little to add, unless it is to say that the influence of the Plein-Air school and the Impressionists seem to grow less as time goes on, and Monet, for the moment any way, is not so much the prophet as Corot.

One improvement is to be noted at the new Salon. The prints have been brought from the lower rooms, where hardly anybody ever went to look at them, to the balcony upstairs where there is space to hang them so that they can be seen. To tell the truth, however, they do not include very much worth seeing. The huge color etching is now all the fashion, and it is used chiefly for the reproduction of pictures, to which the medium does not lend itself. But painter after painter, waking up to its success, has rushed in to profit by it, until one can only hope that this fashion, like so many others, will die from its very excess. Mr. McLaughlin's etchings and M. Warsquier's Japanese-like designs in the new Salon, Mr. Wolf's and M. Hoenemann's wood-engravings, and M. Belleroche's lithographs, in the old Salon, are among the most interesting prints of any kind that are shown.

Among the many drawings in many mediums, I saw nothing that interested me so much as M. Milcendeau's Jour de Marché à Ledesma, a pastel, in which he has managed to forget that any artist ever worked in Spain before him, and by depending entirely upon his own impressions has once more given freshness to a stale subject.

Of the smaller exhibitions within the large, I need only say that in the new Salon a room has been set apart for the drawings of M. Dagnan-Bouveret, and a wall in the decorative art section devoted to the illustrations and wall-papers of Walter Crane.

The French sculptor, like the French painter, enjoys the advantage of definite commissions. He is not reduced to appeal with his every work to the capricious fancy of the chance customer. The old Salon shows numerous examples of his technical skill and accomplishment, though of his genius there is less convincing proof. At the new Salon more space is now spared to sculpture than at first, but not even there does the genius appear in larger numbers with the larger opportunity to exhibit. M. Rodin has nothing save a marble bust of Mme. Elissieff, to which he has given greater charm than he usually seeks in his work, but also a greater degree of finish, with, it seems to me, a consequent loss of character. Of the character which one expects in any portrait, no matter what the medium, I find more in Prince Troubetzkoy's statuette of Baron Henri de Rothschild, standing in what evidently is the pose most natural to him, with no concession to beauty of finish, but, instead, a rugged vigor in the rendering of his heavy and not over graceful form and outlines.

Altogether, if the two Salons help to prove the long-suspected truth that the glory of the big exhibition is on the wane, they still succeed in attracting more of the interesting work done today than do any others. N. N.

There is a growing tendency in certain quarters to regard Aubrey Beardsley as a great master. The latest evidence of this is "Aubrey Beardsley," by Robert Ross (John Lane), in which that artist's slender if real talent is treated with portentous seriousness. At best he had a pretty feeling for long lines, and for the spotting of pure blacks. On the other hand, his sense of structure and his knowledge of the figure were nil, and his sentiment had an evident taint of corruption. He was distinctly *fin de siècle*, and the new century may hope for an art with robuster qualities.

The Pennsylvania Academy of the Fine Arts announces the award of its gold medal of honor, the highest award in the power of the institution to bestow upon an artist, to Thomas P. Anschutz. The present recipient was born in Newport, Ky., October 5, 1851. He was a student in the schools of the Pennsylvania Academy of the Fine Arts, and later in Paris, and has been an instructor in the academy schools since 1881. In the last annual exhibition in Philadelphia, where Mr. Anschutz received the Walter Lippincott prize, there were nearly one hundred representative American works by painters who had studied under him.

Ludwig Thiersch, an historical painter and for some years professor of painting at the Art School of Athens, has died at Munich in his eighty-fifth year. Among his notable paintings were a number done in the service of the Greek Church in the Byzantine style.

The death is announced from Paris of Guillaume Dubufe, the painter, on board a steamship bound for Buenos Ayres. He was born in 1853, the son of the well-known artist, Édouard Duhufe. He was an officer of the Legion of Honor, secretary-treasurer of the Société des Beaux-Arts, president of the Société des Aquarellistes Français, and honorary president of the Société des Décorateurs. M. Duhufe painted the mural decorations for the French building at the St. Louis Exposition. He took the gold medal at the exposition of 1889.

Finance.

THE QUESTION OF AN "INDUSTRIAL BOOM."

Last week's announcement of a $51,000,000 holding company, to own and operate certain dry-goods department stores in New York and other cities, has interested financial markets chiefly as a possible sign of the times. The new corporation does not, and in the nature of the case cannot, aspire to any such trade monopoly as has occasionally been discussed in connection with our great combinations of capital; and the capitalization in this instance cuts no such spectacular figure as the Steel Corporation and the Northern Securities amalgamations of 1901, or even the less startling combinations in the steel and copper trades during 1899. Nevertheless, it is a good while since applications at the rate even of fifty million dollars for outside capital have been witnessed on the market. Large offers of bonds by companies in high standing have been accepted readily enough, even in the doubtful days of 1908; but that is a familiar incident of the year or two following a financial panic. A shock to confidence, a formidable collapse in Stock Exchange speculation, invariably drive the investor into the market for high-grade securities. Uncertain or pessimistic over the immediate possibilities of engagements on a partnership basis,

he naturally takes refuge in engagements as a creditor.

But investment in new stock on an extensive scale, and especially the placing with the public of the shares of industrial combinations with enormous capital, point in a somewhat different direction. If the movement were to extend, it would at least indicate a change in the general public's attitude, for corporation stock has had a poor market ever since investment demand for that class of security shut down suddenly in the last months of 1906, to the great chagrin of railway managers who had already committed their companies to costly improvement plans. If the public were to show a genuine hunger for new stock of industrial amalgamations, we should presently hear talk of reviving the "flotation craze" of 1899 and 1901.

The question whether such a sequel is possible, may be worth considering. That the period which has elapsed since the panic of 1907 has differed in some important respects from the year or two following similar crises in our earlier history, most people are aware. The essential novelty in the present after-panic events has been the repeated display of the spirit of speculation, notably on the Stock Exchange. This is usually taken to mean confidence in speedy return to good times, or, at all events, confidence in return of former high values. The existence of such belief does not necessarily prove that the expectation is well-founded; it may be, and often has been, premature; but it usually indicates in the public's hands a substantial surplus of available capital, and it is this which would render interesting large new experiments in company promotion.

Comparison of this period with the "promotion era" of ten years ago, however, will in numerous respects fail to establish a parallel. The existence of a huge fund of ready money in the public's hands was an important factor in the outcome then; but the appeal to the public's imagination, through the visible trade conditions of the day, was at least equally important. Things were happening in our industrial history which astonished and excited even conservative observers. We were feeding Europe, for one thing; our wheat crops and our wheat exports had surpassed all precedent, while Europe's harvests had failed. Gold was pouring into America from abroad in unprecedented quantity. We were invading Europe's markets for manufactured goods, and had piled up an excess of $600,000,000 in merchandise exports over imports, where no previous year had achieved so much of an excess as $300,000,000. Our bankers were lending huge sums of money to the British government, and buying up control of British steamship lines on a scale which was thought at the time to threaten England's maritime supremacy. This was obvious material for arousing, not only the speculative instinct, but absolute confidence in any sort of incorporated enterprise put out under the auspices of important capitalists. Behind all this was the fact of the accumulation of capital, during the rigorous personal and business economies practised by the people as a whole for nearly half a dozen years.

It can hardly be said that the present period provides a parallel. Favorable considerations certainly exist, and they are for the most part those which existed, and which were pointed out, during the panic of 1907 itself—notably the sound condition of the currency, as distinguished from other periods of the sort, and the wealth and financial independence of the agricultural West. But we certainly have not with us the spectacular trade phenomena of a decade ago. We are not feeding Europe; our wheat exports are almost the smallest since the civil war, and our wheat crops are not running anywhere near the magnitude of 1901. Just now, our monthly excess of merchandise exports over imports has almost disappeared; for the year to date, it is the smallest in a dozen years. We are not importing gold, but have been exporting very heavily. The ventures of 1901 in foreign finance and in maritime acquisition have largely turn out illusion, and we have learned that ambitious experiments with capital, even at home, may go altogether too far.

All this does not mean that the country's present position is weak or precarious. Except for the more or less doubtful question of our grain crops, it may be that the present state of things is financially more wholesome than that of 1901, and that we are in a way to consolidate our economic strength on a sounder basis than in that feverish speculative era. But conditions of this sort have at least some bearing on the question of another "promotion craze." Conservative people are hoping that our financiers themselves will not lose their heads, as they have done on occasion heretofore, and attempt to force an unnatural movement of speculative inflation.

PRODUCT AND CLIMAX

BY SIMON N. PATTEN

(Author of "The New Basis of Civilization").

50c. net, postpaid 55c.

WHAT underlies our industrial discontent, our social unrest? Why is the laborer restless and sullen instead of happy in his task? Why must we create laws providing punishment for acts that ought never to occur to right-thinking people?

After pondering such questions the author finds wanting a proper balance between action in toil and reaction in enjoyment. He contrasts simple country life in which activity evokes immediate and healthy response with conditions in the city where toil and pleasure are incongruously joined.

To bring about the right relation between work and play with the purpose of making a happier race, is the author's aim, and, for the diagnosis of the disease and the suggestions for its cure, those who are interested in social and moral betterment are invited to read

"TONO-BUNGAY"

Narrative Lyrics

See *The Nation* for May 13th, 1909.

The Nation.

NEW YORK, THURSDAY, JUNE 10, 1909.

The Week.

It is positively unfeeling in President Taft to glory over the way in which the hot weather is using up Senators. You can hear something very like a chuckle in his reference to the fact that "the heat is a necessary element in working out our Constitutional government." After his own Philippine experience of tropic temperatures, he seems to think that he will be fresh after all the Senators have withered. As if to make a mock of their sufferings in the Senate chamber, superheated as it is by nature and oratory, the President goes out to play golf, on the theory which all enthusiastic golfers hold, that the higher the thermometer the lower will be his score. It may be, however, that Mr. Taft is not reckoning accurately upon the capacity of Senators to endure heat without light. Tariff bills have been debated before this throughout the sweltering days of a Washington summer. The date of enactment of the McKinley bill, October 1, 1890, as of the Wilson bill, August 13, 1894, is rather ominous. Of course, those measures were passed in the long session of Congress, and it might seem that a better argument, as well as a brighter augury, could be drawn from the Dingley bill. It, too, was the work of an extra session, called soon after McKinley's inauguration in 1897; but the tariff of that year was not passed and signed till July 24. President Taft will be lucky if he gets a bill to sign—or veto—by that day.

Mr. Bryan has often abjured the Presidency more explicitly than he did Monday, when he promised to begin political war upon the liquor interests; but never with such demonstrable evidence of good faith. He knows that the Democrats would sooner stand for excluding foreigners than pick a candidate in any wise committed to the prohibition of beer and whiskey. To his support in 1912, Messrs. Conners and Murphy could not muster a corporal's guard, even if they would. We take it as plain, therefore, that Mr. Bryan, if his words are not misreported, has reluctantly decided to seek his political fortune in a narrower field; and where that field is, one may easily guess. Nebraska likes the Great Commoner, the initiative and the referendum, and also prohibition. Nebraska will soon be casting about for a Senator. Given this situation and Mr. Bryan's voice, the outcome may be foretold even by so wretched a prophet as Mr. Bryan himself.

Saturday's primary election in Philadelphia brought out the largest vote ever cast in a primary in that city. The machine candidate for District Attorney, Samuel P. Rotan, won his renomination by the narrow margin of 5,004 over D. C. Gibboney, the reform candidate. Gibboney ran on three tickets, and won the nomination of the Democratic and William Penn parties. His total popular vote exceeded Rotan's by 25,100, a circumstance that can hardly be described as other than a severe jolt to the machine. Indeed, there are signs that it nominated Rotan only by desperate stratagems and the usual vote-stuffing in certain districts; and the William Penn party announces that it will contest the election and open the ballot-boxes. This popular uprising against the machine does not mean that Philadelphia is at last turning against its corrupt rulers as such, but, in the main, indicates the disgust of the public "with the stock-jobbing politicians who ran the Philadelphia Rapid Transit Company for narrow personal ends, regardless of passengers, trolleymen, and the city, or even the sound business interests of the company itself"—as the Philadelphia *Press* describes it. And there can be no doubt that the Republican machine saved itself only by its surrender to the strikers on Thursday of last week. Had the election come then, or even on Friday, the machine would have gone down to defeat. The public regarded the demands of the strikers as just; they opposed the police, not as police, but as unwilling tools of the bosses, and they quickly saw the politics behind the obstinate and weak policy of the company.

The removal of the sheriff of Mobile County by the Alabama Supreme Court is a great triumph of justice, all the more welcome because it is one of a number of signs that the South is at last waking up to the real meaning of the lynching evil. "If the law is right, mob law is wrong, and must be stopped if there is to be maintained the institution of government in a free country"—so Justice Simpson is reported to have said in pronouncing the court's decision. The Mobile sheriff was shown to have been well warned the day before of the coming lynching; yet he made no preparations to resist a mob, and went to his home early. With the Supreme Court about to punish the delinquent Chattanooga sheriff and with a Texas county proceeding against its sheriff, obviously the time has come for that class of officers to take notice. Jailors, too, like the one who made ineffective resistance to a mob that lynched a negro in Frankfort, Kentucky, last week, should also take note and should be supplied with the admirable story of Sheriff Van Pelt of Pensacola, in the current *Sunday-School Times*. That officer went so far as to try to save a negro criminal last July by firing on his neighbors. He killed two and wounded three personal friends before being overpowered. Yet the public recognized that he was correct in his action by reëlecting him sheriff in November by 1,200 votes.

The proposed national committee on the advancement of the negro, advocated by the Conference which has just met in this city, suggests interesting possibilities. There can be no doubt that a great deal more light is needed on this problem than has hitherto been obtained. In New York, the Bureau of Municipal Research has much more than justified itself; but if the facts are needed in a city, how much more must they be of use with regard to a race? There is the lynching evil; the facts in every case ought to be given to the public—not the sensational charges of irresponsible country newspaper correspondents, nor the first hysterical outbursts of victims, real or feigned. The country ought to know the exact truth as to negro criminality; there are plenty of Southerners, like the Rev. Quincy Ewing, who maintain that it has a wrong impression. Still another suggested field for the national board is that of furnishing legal aid to colored people and of bring-

ing to justice those who commit crimes against them.

Last week the Wisconsin Legislature finally granted autonomy to Milwaukee. The provisions for the initiative under the new law give malcontents every chance to oust the "ins." Should 5 per cent. of all voters sign a petition calling for a vote on some issue, the Common Council may order a referendum; if 15 per cent. sign, the Council must. There is no denying that this might mean demagoguery. Thus, a majority ring of Aldermen and about 4,000 henchmen could put off until the next regular city election—the prescribed date of the referendum—any legislation which ought to be decided upon at once. The henchmen would send in their 5 per cent. petition, the Aldermen would bow to "popular will," and a foolish or corrupt practice would take a new lease of life. Nevertheless, those who have scented radicalism here do not attempt to show that this risk exceeds the usual one, under old-fashioned, boss-made charters. The system at least puts the honest citizen on equal terms with the professional politician. Whatever the latter can do, the former can; and so endurance of bad government becomes a greater offence than ever.

Possibly the liquor war has entered upon a new phase by the act of the United States Brewers' Association binding its members to sell no beer to dealers whom any brewer has placed under a ban. But we shall sound no dirge for the Anti-Saloon League until more is known about the ban, and the placing of it. Doubtless, a systematic and general weeding out of undesirable patrons is one of the moves needed to rehabilitate malt liquors, and all who traffic in them. Certainly, the gravest evils of alcohol, direct and indirect, are those of cheap spirituous beverages, "red eye," "black Joe," and less euphonious variants of fusel oil. Those brewers see clearly who have advocated separate licenses for the two classes of beverages, and also the issuing of but one sort of license to each saloon. Even with this arrangement, however, the beer saloon will not vindicate itself so long as the blacklisting of disreputable bars is left to individual brewers, as the Association seemingly leaves it. Free competition will operate in the future as in the past; each brewer, fighting hard for profits, will turn a lenient eye upon his own bartenders and customers. But once let a national or a State committee sit as moral judge, with power to restrict the sales of all Association members, and the "model saloon" would become a reality, if it ever can at all.

In its timely exploitation of Count Zeppelin's latest achievement, our War Department again displays the press agent's knack of turning current events to profit. But its fleet of dirigibles from Maine to Florida soars a little too high, overshooting wisdom. Doubtless, the Department is asking a reluctant Congress for twice as much as it dreams of getting; but such shrewdness is misplaced in the present case, inasmuch as Congress is wholly destitute of enthusiasm on the subject of aerial navigation. and is nosing so deeply in the tariff trough, moreover, that it cannot even turn one eye heavenward. And it would, in any case, frown upon this huge, costly scheme of coast defence. Astounding though the progress of aeronautics has been, the science is still in its infancy. The art of landing has yet to be learned. Air currents have not been charted. The most efficient size, shape, and degree of rigidity are unsettled points. To build a squadron of dirigibles before our experts have worked out and thoroughly tested a pattern that improves upon the best of to-day, would benefit neither the aeronaut nor the country.

The address of Judge Mulqueen of this city to William Darragh should be posted above the speedometer of every automobile. No chauffeur is quite safe without it. The law under which Darragh is sentenced is neither new nor obscure. A chauffeur's intent, like every other man's, can be known only through his voluntary acts; and, thus inferred, Darragh's wild drive up Morningside Avenue was manslaughter, to say the least. The seven years this reckless young man must spend in prison will, we think, impress other speed-maniacs even less than the court's warning that a rich or dissolute man, convicted under like circumstances, will probably be held guilty of murder. The prospect is by no means fanciful. Indeed, public and courts alike have almost reached the point of regarding the "joy ride" as *prima-facie* evidence that the riders are dissolute enemies of society. They do not aim at any wayfarer in particular, but no more does the cowboy who "shoots up" a town.

Mohammed never could have had so much trouble with his apostates and false prophets as does Mrs. Eddy. Simple and monotonous would be Mohammed's answer to a Mahdi who called the reporters to his suite in the hotel and announced that the founder of Islam was either dead or in his dotage. A swish of the scimitar would close the debate. But Mrs. Della M. Gilbert, the new prophetess of Christian Science in this city, cannot be dispatched so neatly. She avers that Mrs. Eddy is dead, or mindless. How can Mrs. Eddy prove herself neither? If her mind is gone, she exists no more, for "mind only is real." Let her swear, in the tongue of angels, that she has a mind; let her don a violet silk gown, drive past a committee of reporters, and wave a glove at them; she may persuade infidels who believe in matter and the senses, but how can all this win back readers of the *Sentinel?* If they think her off the earth, off she goes, unless her party can think her on it more strongly.

We should regret it very much if the report should be confirmed that Canada is to build a navy of her own. Even if it is only a coast-guard fleet, it is sure to be taken up by some of our navy-maniacs as reason for heavier American armaments, and there would begin at once that friction and suspicion which are such inevitable accompaniments of the appearance of new war-vessels. The latest example of this is Italy; recent dispatches reported a "perfect naval panic" in government circles and a determination to build ships at any cost to maintain control of the Adriatic. Why? Because Austria has suddenly gone in for Dreadnoughts. For years the two nations have been peaceful enough neighbors, so far as naval questions are concerned. But the instant Austria builds Dreadnoughts—purely for defence, of course, and without thought of aggression—Italy must hasten to impoverish herself by outdoing the Hapsburg building programme. Our relations with Canada, the absence of forts and warships on our northern frontier, have been an object lesson in peace and common-sense for the whole world.

Anything which changed those relations and caused doubt and distrust would be a world-misfortune.

Lord Rosebery, addressing the Imperial Press Congress in London last Saturday, spoke with solemn emphasis of his fear of war. Real causes for hostilities were absent, but preparation for hostilities was being pushed with fevered and frantic haste. To the perspicuous mind, this absorption in getting ready for war makes the outlook most ominous. Not for Lord Rosebery is the cheap fallacy that the wild rush into great armaments is along the path of peace. All the talk may be for peace, but if all the action is for war, the chances are tremendously in favor of war. The "just man armed" may all too easily become the self-confident bully aching to try his weapons. And when the murderous work begins, the aggressor will look to the big navy, as Macbeth to his dagger:

Thou marshall'st me the way that I was going,
And such an instrument I was to use.

All this was perfectly clear to Lord Rosebery. He declared plainly that fierce competition in guns and ships leads directly to war. Where it would end, short of a general lapse into barbarism, he could not say. One faint hope he saw if the workingmen of the world should find themselves so staggering under the burdens of militarism that they would say: "We will have no more of this madness and this foolery, which is grinding us to powder." Yet Lord Rosebery, with the customary and seemingly frenzied inconsistency of most public men who discuss this question, was ready to add that England would never draw back; she would "build Dreadnoughts as long as we have a shilling to spend or a man to put into them"; and if that were not enough, as he was afraid it might not be, she would call upon her colonies to save her. Not a word about any possible alternative. If the workingmen do not prevent outbreak of war, European statesmen can do nothing. Such is Lord Rosebery's counsel of despair!

"While he has preserved his quality as a thoroughly patriotic German, he has also been, under all circumstances, one of the truest friends that the United States has ever had in Europe; indeed, I should say the foremost friend since Bright, Goldwin Smith, De Gasparin, Laboulaye, and their compeers stood by the Union during our Civil War"—thus wrote Andrew D. White two years ago of Dr. Theodor Barth, whose unexpected death was announced last Thursday. No one was in a better position to value his services to this country than Mr. White, our Ambassador to the court of Berlin during the trying years of the Spanish-American war and of the Philippine insurrection. Throughout that period Dr. Barth was one of two German editors who stood up for the United States. Not that he believed in either the war with Spain or the conquest of the Philippines; he was too sincere a democrat, too loyal to our best American traditions, to approve those undertakings. But, as Mr. White has phrased it, Dr. Barth "could look beneath the surface of American affairs and understand the mass of good existing beneath the scum of evil." And because he was a believer in true democracy, he never for a moment lost faith in republican institutions or ceased to advocate the doctrines of Liberalism in his own land. He was indeed, not of Germany alone, but of the world. Those who have drunk such deep draughts of democracy as he, are no longer to be restrained in their sympathies or their influence by national boundaries. It is impossible to think of John Bright, of Richard Cobden, or of Gladstone as Englishmen alone, any more than we can claim Lincoln as exclusively our own. Such tribunes of the common people are common property wherever the word liberty is heard.

The annual meeting between the Czar and the Kaiser is an event of the near future. The usual professions concerning the historic friendship between the house of Hohenzollern and the house of Romanoff will be forthcoming. Meanwhile, the Russian military authorities are showing their concern over the reorganization of the Empire's defensive plans against Germany. Ever since the disposal of the Balkan question by the Kaiser's alleged threat of an invasion of Poland, Russia has become acutely conscious of the weakness of her western frontier. Gen. Kuropatkin, in his memoirs of the Russo-Japanese war, has laid particular stress upon Russia's need of concentrating her attention on that frontier. He has pointed out that with Russian Poland jutting out like a wedge between German Posen and Austrian Galicia, Poland might be a source of strength or weakness, according as the Russian army was powerful enough to use it as a starting-point of invasion or was compelled to hold it against a double attack from the north and south. To Kuropatkin's eye, the difficulties of the situation outweighed its advantages. When it came to mobilization, Germany, with seventeen lines of railway and twenty tracks running to the Russian frontier, could throw a million men into Poland in a short time. Against Germany's seventeen lines of railway, Russia has only five. Austria has eight lines, with ten tracks, against Russia's four. In case of war, therefore, the Czar's troops would be almost inevitably on the defensive.

For the third time, Alfred Deakin has become Premier of the Commonwealth of Australia. The Labor Ministry under Andrew Fisher has been defeated by a coalition of the Deakin Protectionists and the Liberals, in accordance with the swing of Australian politics during the last six years. Protectionists, Liberals, and Laborites are all too weak to rule by themselves, and in consequence Australia has been in a state sometimes described as a "triangular anarchy." But though Australian Cabinets have lacked stability, anarchy is an unfair term. Far from being hopelessly at variance, the three parties are sometimes desperately exercised to discover sufficient issues to fight over. Protectionism of some kind or other is accepted by all parties; there is no wide difference of opinion on the question of a White Australia; and there is virtual unanimity on the duty of the Commonwealth to contribute to the defence of the Empire. In what form such aid should be rendered, opinions differ. The Fisher Cabinet advocated the assumption by Australia of the defence of her own coasts, but this policy, approved by the best element, would seem to have been swamped in the recent outbreak of Dreadnought mania. On this issue, and on the question of a progressive federal land tax, the Fisher Ministry would seem to have been defeated. "Every man and every institution interested in land valued at more than £5,000," says one dispatch, "is intent on putting the Fisher Ministry out before the next general elections."

METHOD IN SENATORIAL MADNESS

It would be a very simple-minded Muse that would respond if called upon to sing the wrath of a tariff-making Senate. There appear to have been, it is true, some sublime exhibitions of celestial rage. Senatorial courtesy has taken on the odd form of "You're a liar!" and the exquisitely polite and witty retort has often been heard: "Yah! You're one yourself." There have been terrible "encounters" with the safe weapon of the tongue, and fearful "collisions" at the convenient distance of the width of the Senate chamber; but the attentive observer cannot help feeling that there is something very theatric about all this. He sees that Aldrich and his obedient followers, at all events, in the very torrent, tempest, and, as we may say, whirlwind of their passion, are able to make it "smooth" in a sense of that word unknown to Shakespeare.

What we mean is that behind the scene of all this petulance and flurry, Senator Aldrich, Senator Hale, and their aides and confederates are quietly perfecting in secret the bargains by which they hope to make the last tariff state of the American people worse than the first. Significant evidence of this came out the other day. Senator Brown of Nebraska asked when the Finance Committee was going to report its proposed duty on wood pulp and printing paper. Aldrich replied that the amendment was not quite ready. He could assure the Senate, however, that this schedule would be reported soon, and would contain duties somewhat higher than those of the Payne bill, but lower than those of the existing law. Now, why has this schedule been held back all these weeks? Why are the duties on coal and coke—products which the House voted to put on the free list—still held "subject to modification by the Senate"? Obviously, in order that the tariff-traders and log-rollers may have material with which to do their nefarious work. They have kept some of their cards under the table, to be produced when it is necessary in order to win the game. While the oratory and the anger have been displayed in the public sessions of the Senate, the real work of distributing tariff favors and ratifying tariff bargains has been done behind closed doors, in committee rooms, or hotels or clubs. That is the method in all this Senatorial madness.

Nowhere is there any pretence that the Senatorial cabal gives a moment's thought to either the interests or the desires of the whole people. The tariff is the private business of Senators. They will attend to that. They talk vaguely, it is true, about consulting the wishes of their constituents, but they mean only that handful of manufacturers or chiefs of corporations who are rich enough to spend weeks in Washington lobbying, who have financed party campaigns and Senatorial elections in the past, and stand ready to do it again if they are allowed to write the clauses of the tariff which mean money in their pockets. A good typical case is that of the New Jersey Senators. They are ever to be found among Aldrich's fine brute majority, voting for all the high and higher duties. Yet Messrs. Kean and Briggs know perfectly well that New Jersey is a low-tariff State. It gave its electoral vote to Cleveland three times, largely on that issue. The sentiment even of the Republicans of New Jersey is unquestionably in favor of President Taft's recommendation of a revision downwards. Yet the two Senators continue to misrepresent their party and affront their State by always counting with Aldrich's high-tariff cattle.

They furnish only one illustration of the way in which a powerful "hog combine" in the Senate has been scheming and plotting, and buying and selling votes, in order to defeat the House, thwart the President, and cheat the country. As the success of these Senators becomes more evident, their effrontery increases. The mask which they discreetly wore for a time, they are now throwing away. At first, they gave out that they were entirely with Mr. Taft. Then when they were found destroying the free list and going for outrageously high duties, they explained that they knew this was not what the President wanted, but that they would see that the conference between the two houses made a tariff to suit him. But now they are saying that, so far as they know, Mr. Taft is well pleased with their out-Dingleyed bill, and that there is no reason why he should not sign it. Evidently, somebody is deceiving or deceived. As the hero asks in Beaumarchais's play: "Qui trompe-t-on ici?" There are signs in the Washington dispatches that the President is awakening to the double game which certain Senators have been playing with him. Their protestation that, though they were working tooth and nail to make a very bad bill, they really intended to make it a very good one before they finished, was all along suspicious, and now plainly appears as a mere trick. To meet it, Mr. Taft's friends in Washington are saying that he will soon make his position known publicly—by speech or letter. The time is rapidly coming when he must do so if he would not see the extra session worse than wasted, his hopes dashed, and his promises flouted.

INTERNATIONAL BAD MANNERS.

We do not know which Germany will regard as more insulting—the attacks upon her by our high-tariff Senators, or their later eulogies of her. Either, we should say, would be pretty hard to put up with. That particular display of bad manners has no great importance in itself. Foreigners have, by this time, come pretty well to understand the playful ways of our Congressmen. And as they are more and more taking up with high tariffs themselves, they see better what a provocation of anger, malice, and all uncharitableness the system of protection is. Trade wars may be the bitterest of all; and in the matter of offensive epithet applied to foreign commercial rivals, neither the German nor the English pot can call the American kettle black. From laying a prohibitory tax on foreigners' goods to charging him with trickery and deceit, is but a natural and easy step.

The evil, however, does not stop with tariffs and taxes. In all the relations between countries, there persists a vast and wholly unreasonable amount of suspicion, dislike, and latent antagonism. The Prime Minister of England recently confessed that this kind of international exasperation appears to be growing. "We live," said Mr. Asquith, "in a scare-mongering age." And the scares, of course, are all concerning the wicked designs of unscrupulous foreigners. Frank Dr. Johnson said that all foreigners seemed to him to be fools. And knaves, we add to-day. They are all the while scheming to trick and cozen us; while we, of course, are merely seeking by lawful and honorable means to take our rightful place in the world—simply to "sit in the sun," as the Germans phrase it.

Two statesmen have recently borne striking testimony to the extent and

harmfulness of this spirit of international misunderstanding and animosity. Senator Root's speech at the Peace Dinner had a passage of manly protest at the ignorant and barbaric attitude of many in this country towards the Japanese. And the other day at Mohonk, Ambassador Bryce uttered some forcible words about the urgent duty of removing "the atmosphere of suspicion" which now seems to envelop all the great Powers of the world. It is commonly said that reckless and sensational newspapers are to blame. Doubtless, they have their share of the guilt to bear, and it is a grievous one, but Mr. Bryce affirmed truly that irresponsible editors vilify foreigners only because they think the public craves such attacks. The British Ambassador added:

> Thus we come back to the people—that is, to ourselves, the ordinary citizens who are the ultimate masters both of the government and of the press. Why do we like to have other nations placed in the worst light and their defects exaggerated? Why is it thought patriotic to defy other nations and unpatriotic to indicate any faults in ourselves, any weak points in our own case?

The answer to these questions is—"pure ignorance." Bad manners go with defective education. The boor would behave better if he only knew how. And these recurring displays of international ill breeding simply show that millions of people have not emerged from that sunk condition of ignorance when every tribe thought that the men over the river or across the mountain range were natural and inveterate enemies, always lying in wait to burn and kill. To that kind of barbarism, trade jealousies and the mad competition in armaments seem to be carrying the world back with a temporary lurch. But it will be only temporary. The means of spreading knowledge are too varied and invincible to permit the darkness to settle long upon us. There is no way of laying a protective tariff on ideas. Free trade in them will go on, and will in the end scatter the anarchs and Old Night.

In all this matter, we have to discriminate between the international bad manners of public men and of private citizens. If the former are more dangerous, the latter may be more nettling. Peace may be imperilled by the statesman, but by the traveller complacency is upset. The amount of ill-will created by English writers about the United States is proverbial. But that, too, is passing away. We are not so thin-skinned to foreign critics as we used to be. If they can teach us anything, so much the better; if we can catch them ludicrously tripping, that heightens our joy. The composure with which Ferrero's criticisms have been received, as compared with those of Mrs. Trollope and of Dickens, speaks much for our gain in good nature and in philosophic calm. To take in good part even the sharpest pen-thrusts of a foreigner, is getting to be a world-trait, a form of international good breeding. An American, Price Collier, has, for example, published recently a book on the English. It is filled with briery comment, but the English reviewers seem to write of it good-humoredly. Thus the *Westminster Gazette* quotes what the author says about the English diet:

> Meat, meat, meat, and no alleviation. The vegetables are few, and even they, as Heine phrased it, "are boiled in water, and then put upon the table just as God made them." . . . The eternal round of eggs, bacon, sole, beef, mutton, ham, tongue, and chicken, with potatoes, and cabbage, and cheese, is the familiar diet of the Englishman. Nor does he complain. He wants nothing else.

But it immediately adds:

> Of course, he does not!—especially when, together with his eternal round of eggs, etc., the gods occasionally send him, among his mental food, such books as Mr. Collier's. Then he complains less than ever, but rejoices exceedingly, and reads the book from beginning to end.

That is both good sense and good manners. If all international pin-pricks could be dealt with in like fashion, the peace of the world would be more secure.

MAKING SCHOLARSHIP RESPECTABLE.

President Lowell's address at Columbia University last week carries with it the interest that always attaches to the first pronouncement of policy under a new reign. What will the young King do? Will he follow in the footsteps of his predecessor, request his Cabinet to retain their portfolios, and declare his firm adhesion to the treaties and alliances entered into by the late monarch? Or will he dissolve Parliament, clap the Minister of Finance into jail under charges of defalcation, hang the chief groom of the bed-chamber, and announce his intention to make a radical change in his country's foreign relations? The latter course has been followed, but only by hot-headed young princes. The wise ruler, upon assuming the crown, will come out for no such open break with the past, however strong his determination to govern in accordance with his own ideas. He will promulgate his complete agreement with the policies of his predecessor, but will let it be known that no rough riders, heroes of the hunting-field, and famous halfbacks need apply. He will declare for the strict enforcement of the law, but will draw the line at brass bands. He will assume responsibility for the success or failure of his reign, but will refrain from calling up his ministers on the telephone at 2 A. M. And in the end he may have built up a fairly satisfactory policy of his own out of his slight exceptions to the policies of the preceding reign.

Some such procedure is forecasted in President Lowell's Phi Beta Kappa address. The development of the elective system is the policy with which Dr. Eliot's name is commonly connected. Of the elective system, Harvard's new president has drawn up a sharp arraignment. It is true that he approaches the subject from a single side, from the point of view of one who believes that it is a powerful function of the university to foster expert scholarship. Our graduate schools are not a success, if we compare the progress of scholarship in our country either with our advance in material welfare, or specifically with the excellent work done by our professional schools. And the trouble is not that our graduate schools are deficient in the machinery of specialized training, but that they are compelled to work with unpromising material. "The graduate school," he says, "can train scholars, it cannot create love of scholarship." Such love of scholarship should be imbibed and cherished in the college, but is not; and the fault lies in the lack of the stimulus of competition. In the preparatory school we have the stimulus of discipline, of a prescribed programme. In the professional school there is the powerful stimulus of fitting one's self for earning one's livelihood. But in the college, under the elective system, there is compulsion neither from without nor from within. There is none from within, because the elective system, in breaking up the uniformity of undergraduate training, has done away with the stimulus of rivalry

which should be quite as effective in the intellectual sphere as in athletics or business.

But Dr. Lowell perceives that the elective system cannot be done away with. "No saue man would propose to restore anything resembling a fixed curriculum in any of our larger colleges. We must not go backward; we could not if we would." Remains, therefore, the task of infusing the spirit of emulation into college work by other means. Dr. Lowell thinks it necessary to free the specially gifted student from the drag imposed upon him by a minimum of scholarship fixed in accordance with the needs of the average man, and sometimes even the dunce. Some such system of honor and pass-examinations as obtains in the English universities would be in line. For the essential point is to endow scholastic proficiency with some of the outward distinctions that are so effective in rousing the spirit of competition in the heart of youth. At present, exceptional proficiency in a college student is *prima-facie* evidence of guilt. He cannot stand high in his studies without being that most dreadful of all college species, a "grind." Let us accept this common prejudice as a fact, says Dr. Lowell. Let us devise some system of examinations and rewards that shall be closed to the mere "grind." Just as making the eleven or the eight is a testimonial to extraordinary physical powers, let there be a mark by which we can distinguish our intellectually select.

President Lowell's appeal ought to find a wide response. We are not oversanguine. We do not expect to see honor examinations in mathematics or Greek conducted in the Stadium amid the cheers of thirty thousand spectators. But we have little doubt that if college presidents were as interested in advertising the scholastic attainments of their honor men as they are in the success of the football team, men with brains would cease to be actually ashamed of the fact. The tyranny of college tradition is notorious, and the tyranny of the athletic tradition is as the iron caste laws of the Brahmins. The serious student and his teacher subscribe to it as meekly as the most devoted of rooters. The man who would rather spend an hour or two with Stevenson or the Arthurian romances feels that he is breaking the law which requires his presence at lacrosse practice. The man who is unfortunate enough to get an A in his English and history slinks about with a haugdog look. It does not matter that his lessons cost him almost as little time as they do the captain of the football team. It does not matter that he spends delightful hours in the book alcoves with Lecky or the wicked minor Latin poets. No. He gets along well in class; he shows interest in his books. Therefore he is a grind, something less than a man.

If President Lowell shall succeed in vindicating the claims of the bookman against the athlete, he will have done a memorable service. College tradition grows by sufferance. A sharp dig or two at muscle-worship, a word of praise for efficient brain-work, and the silly tradition will have lost much of its effectiveness. Nor does that mean that brains and sane indulgence in athletics are incompatible. It is quite the other way. Because of our present worship of the athlete-hero, the ordinary good scholar is so completely shut off from outdoor play that he feels himself a lamed being and ashamed, ashamed of what he can do as of what he cannot. When college athletics shall have learned to take care of every student, the undergraduate who can run a little, swim a little, and make a fair showing on the diamond, will not be ashamed to make an exceptional showing in the classroom.

"IN-BREEDING" IN COLLEGES.

Critics of American colleges and universities have had not a little to say about what they call "in-breeding" in the faculties. By this is meant a tendency, actual or fancied, to prefer local graduates for local appointments. The implication appears to be that inbreediug is, *per se*, a perilous practice, and that if only the authorities can be brought to see that they are doing the accursed thing, they will stop it forthwith, and return to a healthful and beneficent exogamy. It is possible to object, however, not only to this species of "reasoning from analogy," but also to the validity of the analogy itself as supporting the position advocated. Logically, the argument bears a strong family resemblance to the kind which once graced the discourses of the old-school political orator, the expounder of modern policy upon the basis of what passed for the experience of Imperial Rome. This sort of "reasoning" comes to jar on the nerves, if one feels obliged to take it seriously; for, after having been cozened a few times by some striking but really empty or misleading parallelism, one discovers that the bulk of this sort of argument is no more than a slurring over of real distinctions.

Even allowing aualogy its due—for it often has suggestions of high value—let us consider this one of in-breeding. The parallel is plainly with human consanguineous unions, for if it were made to refer to animal or plant-breeding, it would mean little to the non-specialist. It is manifestly an appeal to the folk-prejudice against the union of near kin, a prepossession which, along with other popular beliefs, has beeu accepted without verification. Now, any thinking man realizes that human beings carry about a number of these unverified group-ideas—unverified, because life is too short and the power of the mind too limited to test more than a few of them. But they ought to be identified early in the intellectual life as a species, and as a probable source of error.

As a matter of fact, the analogy, when critically examined, yields, in several of its phases, an exact opposite of the conclusion which it is cited to support. It is not certain that even human consanguineous unions are so disastrous as people have often supposed; in any case, who could maintain that they have had less desirable results than unions from which indiscriminate human mongreis have sprung? But expand the analogy so that it takes in plant and animal-breeding. The only way to procure an animal or plant type that has any special individuality or value is precisely through isolation; that is, strict inbreeding; the way to lose such a type is to mix up the strains. After a while, to be sure, it is well to introduce some fresh blood; but this must be done with discrimination. Perhaps, if it is desired to get a product that "never was on sea or land," it would be advisable to mix varieties to the uttermost. Now, if this interpretation of the analogy be applied to a college, the case would stand something like this: if your type seems to you to possess any special value, keep up a good degree of isolation, introducing fresh blood spar-

ingly and giving it time to become diffused; if you are disgusted with your type, break it all up and start over again, by thoroughly mixing the strain and awaiting variations from which to select a novel breed. The implication in the latter case is that anything is better than what you have, for nobody knows what bizarre forms you may succeed in producing by extensive mixture.

In short, seen aright, the analogy (neglecting its vagueness and its amusing side) reduces to this: faculty in-breeding may be bad or good, according to the circumstances. But policy in the matter ought not to be influenced by an unconsciously ignorant assumption that all organic in-breeding is bad. The issue is: Good for what? Bad for what? Some faculty types should not receive perpetuation in their existing form—that is freely granted. Let these out-breed. Other types are peculiarly and characteristically strong. They are impossible, apparently, of duplication, because of that indefinable something that might be called spirit. Let these in-breed as a policy, and out-breed only within the limit of the full preservation of their individuality. Let them out-breed enough to secure constant slight variations from which gradually to improve their stock; but let them beware of running to unpredictable mutations and "sports."

This argument by analogy is slippery in the extreme, however conscientiously it is used. At all events, educated men should not allow themselves to be taken in by careless reasoning from analogy on the part of others; and they should be properly humiliated if they detect themselves in the fallacy.

NEWS FOR BIBLIOPHILES.

A bibliographical account of the very rare map of Kentucky made by John Filson for his "History," published in 1784, has been prepared by P. Lee Phillips, chief of the map division of the Library of Congress, to accompany a facsimile reproduction made from the map recently acquired by the library. The volume, a quarto of twenty-two pages, besides the map, is published by W. H. Lowdermilk & Co. of Washington. They announce that if sufficient encouragement is received, similar monographs will be published on other rare American maps, such as Romans's map of Florida (1774) and Hermann's map of Virginia (1673).

Of Filson's map with imprint "Philad'a. Engrav'd by Henry D. Pursell, & Printed by T. Rook, for the Author, 1784.", six copies are located by Mr. Phillips, three in public and three in private libraries. The public libraries possessing impressions are Harvard, Public Library of Philadelphia, and Library of Congress. The private collections are those of the late E. D. Church and Robert Hoe of this city, and Col. R. T. Durrett of Louisville, Ky. The late E. C. Bigmore of London, an astute and careful student, informed the present writer some years ago that he had seen two genuine impressions of the map in the archives at Salamanca in Spain. At the time we had before us the Kalbfleisch-Pope copy (now Mr. Hoe's), and there is no reason to suppose that Mr. Bigmore confused the original Philadelphia map with either the French reproduction of 1785 or the English one of 1793. The two copies are probably still in Spain. Mr. Phillips has discovered a number of variations between the Library of Congress and Harvard copies, showing that the latter is a later impression taken after some alterations had been made to the plate.

"The Library of Rameses the Great," a lecture by Dr. Charles L. Nichols, read April 15, 1908, has just been published by the Club of Odd Volumes of Boston, as a pretty little book, with frontispiece and vignette engraved by Sidney L. Smith. Eighty-seven copies only are printed. Iamblicus, writing in 325 A. D. of the Egyptian mysteries, said that there were 20,000 books in this famous library, probably papyrus rolls preserved in cylinders. Dr. Nichols refers to several manuscripts in the British Museum and elsewhere, which may have formed a part of it, but nothing definite can be identified. Four pillars only are still standing of this, the oldest of all public libraries.

The Merwin-Clayton Sales Company of this city will hold sales on June 14, 15, 16, and 17. Several specimens of early printing, books on the Indians, and early settlements of the West; first editions of James Fenimore Cooper; a book from Longfellow's library, with his autograph, and a twelve-line poem in the autograph of Thomas Bailey Aldrich, are included.

The American auction season is about over, and not much of importance will be included in the few remaining sales.

The library of Henry B. H. Beaujoy is being dispersed by Christie Manson & Woods in London. The first portion was sold on June 7, 8, 9, and 10, and the second is to be sold on June 15, 16, and 17. "La Mer des Histoires" (Paris, 1488); the first Virgil, with a commentary (Venice, 1475); a fine French manuscript Psalterium (14th Century); Purchas's "Pilgrimes," 5 vols. (1625-26); and the first edition of Walton's "Lives" (1670) are notable books of the second portion.

On June 25, Sotheby, Wilkinson & Hodge will sell in London a collection of old books from the library of Col. Cotes. The first collected edition of Beaumont and Fetcher (1647), with "The Wild Goose Chase" (1652) bound in; "The Pilgrimes Progress," eighth edition (1682); Milton's "Paradise Regained," first edition (1671), in the original calf; a fourth folio Shakespeare (1685); Warner's "Albion's England," first edition (1586), and the first edition of the Sarum Missal, printed in England (1498), are notable books which are offered.

Correspondence.

WAS JOHN COTTON THE PRECEPTOR OF SIR HENRY VANE, JR.?

TO THE EDITOR OF THE NATION:

SIR: J. Wingate Thornton ("The Historical Relation of New England to the English Commonwealth"), seeking to establish the influential relation of the Massachusetts Puritans to the leaders of the English Commonwealth, thinks that Vane was a principal channel of that influence, and goes so far as to assert that "Vane was trained in Cotton's study." Dr. J. K. Hosmer ("Life of Sir Henry Vane") says, "This is scarcely too much to say," and gives a beautiful imaginary picture of the relation of the two men, when Vane was Cotton's guest. No evidence of this training and education is brought forward. It seems to be a pure conjecture, without any substantial proof, from the fact of Vane's residence in Cotton's home. From what we know of the two men, the probabilities are all against the reasonableness of the conjecture. We know that Vane could teach Cotton on the subject of religious toleration: why not also on the subject of church independency and polity, of true democracy in church government? In those days the two subjects seemed to be indissolubly connected.

We have no means of knowing how definite and fully ripened Vane's views were when he arrived in Boston. Edwin D. Mead says (the *Nation*, May 13, 1909): "When he came to Boston to live with John Cotton he was not an Independent, and when he went back to England he was. The inference would seem to be simple," that is, as to the fact of his training under Cotton. Perhaps not so simple, after all. It might be replied: neither was Cotton an Independent when Vane came to Boston, and more than that, he never became one, and was hardly qualified to be a sympathetic and successful teacher. So far as we have any knowledge, Vane was an independent in sentiment when he reached New England, and his experience here simply confirmed him in views already accepted, instead of teaching him new and broader views which his supposed teacher never accepted. His "training in Cotton's study" was of the kind that establishes the views which are not taught; that is, a teaching by repulsion. It is made certain by abundant testimony that Vane was an outspoken and fully ripened Independent at once when he returned to England. He was elected to Parliament in 1640, and immediately, says Dr. Ireland, "the leaders of the Independent party in the Commons were the younger Vane and Oliver St. John." Baillie, speaking of the Parliamentary discussions at that time, praises naturally the orators on the Presbyterian side, that is, those who declaimed in defence of the narrow polity and intolerance of the Presbyterians, and adds significantly, "Yet Henry Vane went on violently," on the side of the Independents.

It ought not to be necessary to repeat what is so well known and universally acknowledged, that Independency in England and Puritanism in Massachusetts Bay were not synonymous. They did not stand for the same things, either in the matter of civil or ecclesiastical polity. Dr. Hosmer says:

The first hint at Independency is perhaps found in the writings of Zwingle. [A more accurate statement would be in the publications of the Swiss Anabaptists in the sixteenth century.] It *first took form in England*, however; then developed fully in America. [It should be said it was many years in developing.] While Prelacy was dominant in the time of Elizabeth and James, little congregations of Brownists or Separatists appeared here and there in England, some of which went to Holland.

As a proof of the lack of identity between Massachusetts Puritanism and English Independency it will be sufficient to quote Dr. Henry M. Dexter, a recognized authority, who says ("Congregationalism as Seen in its Literature," p. 463):

The early Congregationalism of this country was Barrowism and not Brownism—a Congregationalized Presbyterianism, or a Presbyterianized Congregationalism—which had its roots in the one system and its branches in the other.

This important distinction between the English Independents of that period and American Independents (?) is clearly brought out by J. A. Doyle ("The Puritan Colonies," I, 127):

To such an one as Vane life in New England must have been a continuous disenchantment. [This is a plain recognition of Vane's advanced position in Independency before he came to New England.] The more cultivated men among the political reformers valued and sympathized with Puritanism. But they valued it in its moral and political aspects, as a means for the regeneration of the individual, as an ally against corrupt courtiers and arbitrary statesmen, rather than a system of theological dogma. To them the Independent system meant one under which self-constituted societies, freely brought together by common beliefs and aspirations, might work out the problems of spiritual life. In New England it meant the arbitrary rule of a tyrannical public opinion. Moreover, to men familiar with those theories of human rights which were now asserting themselves, the ecclesiastical jurisdiction of Massachusetts must have seemed a violation of all sound principles.

The same fundamental distinction between Brownism or English Independency and so-called American Independency is recognized and set forth as follows by Prof. Herbert L. Osgood ("American Colonies in the Seventeenth Century"):

Not only was it [religious freedom] a fundamental tenet of Robert Browne, but it lay at the basis of true Independency. The Puritans of Massachusetts were in theory Independents, and had they remained true to the principle upon which their movement began, they must have welcomed the doctrine with which the name of Roger Williams is identified. But largely under the pressure of political necessity, the Massachusetts leaders had from the beginning committed themselves to a limited and Presbyterianized Independency. In order to secure unity and strength they had sacrificed freedom (I, 235).

Finally, the tendency toward democracy in ecclesiastical and civil government was counterbalanced by the necessity for the maintenance of order and authority. The more aristocratic phases of this system were reproduced by the Presbyterians of England and Scotland; the more democratic by Robert Browne and his followers, the Separatists. An intermediate position came to be occupied by the Puritans of New England (I, 203).

In 1634, the year after Cotton's arrival in Boston, he issued a publication entitled "Questions and Answers Upon Church Government." This publication was reissued in 1643. In it Cotton maintained, according to Dr. Dexter (p. 424), "that Christ has committed government partly to the body of the church, but principally to the Presbytery of Ruling Elders." The system of ruling elders was out and out Presbyterianism to that extent. Dr. Dexter declares (p. 699):

Our historic original New England Congregationalism was a purely Presbyterian polity, only that it was applied to, and stopped short with, the local assembly.

The system was more and more departed from as the years went by, to the regret of prominent leaders. John Wise writing in 1717 ("A Vindication of the Government of N. E. Churches," p. 88), "pleads for the old New England way, as he understands and advocates it, with Ruling Elders holding their place.

Of "The Way of the Churches of Christ in New England," Cotton's publication, which Mr. Mead thinks had influence on Vane, Dr. Dexter says (p. 434): "In this I think of nothing which requires mention as adding to, or especially modifying, the views already propounded." The Cambridge Platform distinctly declared, "The term Independent we approve not." Hugh Peters said (1643), "We are much charged with what we own not, viz.: Independency." There were undoubtably different shades of belief among the churches. It was a time of transition. Some of the leaders, including Cotton, were charged with inconsistent utterances. It is doubtful if among the early New England churches of "the standing order" there were any Independent churches in the English sense or any Congregational Churches in the modern sense anywhere, excepting in the Plymouth Colony. In its ripest stage for many years it was, to repeat Dr. Dexter's accurate phrase, "Presbyterianized Congregationalism." Dr. E. H. Byington says ("The Puritan in England and New England," p. 108):

The present Congregationalism is much nearer that of the Plymouth Church than that of the Cambridge Platform.

Under that Platform churches bearing the name Presbyterian, though of the Congregational sort, were organized for a century and more. An illustration is found in Providence, R. I. The First Congregational (now Unitarian) Society in Providence, organized as late as 1720, was called Presbyterian. In a discourse on the history of the church, delivered in 1836, by the pastor, Rev. Edward B. Hall, occur these words:

The first name given to this Society, Presbyterian, I know not how to explain. It is found in the earliest records and deeds, and was long the popular, if not the only, name. . . . It is still better known probably, at least to those in this vicinity, than any other name.

The land on which the first house of worship was erected, was conveyed in 1723 to "Feoffees in trust for the Presbyterian or Congregational Society in Providence." The terms were employed interchangeably or as mutually descriptive.

No fact in history is more incontrovertible than that the Independency of England was more advanced, and more consistent than the Congregationalism of New England. The extent of its diffusion is often underestimated. The Brownists or Separatists, and the Baptists were in harmony in their views of religious liberty and of church polity. They were all Independents or Congregationalists. The Independents did not become a political party until near the close of the first third of the seventeenth century. But they had long been a positive and increasing force to be reckoned with among the religious forces of the English people, and were so active and aggressive, in spite of bitter and persistent persecution, that they had not a little to do in bringing about the English Commonwealth. They were strong enough and numerous enough to become the dominant party in England under Cromwell. Fifty-five years had passed between Browne's movement at Norwich, and the emigration of Vane, and Browne's priority is disputed by some Baptist historians. A half-century and more is ample time for a harvest, when the soil is ready. It is stated by an opponent that the presses of the Baptists "did groan and sweat under the load of their publications," which scattered everywhere their leavening influence. Green, in his "Short History of the English People," calls attention to the fact that "at the beginning of the seventeenth century scores of Independent congregations existed in England and Wales." Thomas Erskine May ("Constitutional History of England" II, 296) says: "Before the death of Elizabeth (1603) the Independents had spread themselves widely through the country." Sir Walter Raleigh declared in Parliament, before the close of the sixteenth century, that "he was afraid that there were nearly twenty thousand Brownists in England." Evidently "the New England Way," so-called, was not a new way in old England, unless its modification made it such. Vane had a thousand better qualified teachers at home, and it is safe to say, had learned his lesson well, so that he had little need of Cotton as "preceptor" during his brief experience in Boston. This will easily account for the fact which Mr. Mead, who nevertheless advocates the claim for Cotton, acknowledges, when he says: "It is also certain that the learner advanced far beyond the [supposed] teacher." At any rate, we must accept Cotton's own testimony as to the position he held, viz., "Democracy I do not conceyve that ever God did ordeyne as a fitt government eyther for church or commonwealth."

HENRY M. KING.

Providence, R. I., May 14.

MAJOR WIRZ AT ANDERSONVILLE.

To the Editor of The Nation:

Sir: In support of the contention which has been recently made, that Major Wirz was not responsible for the conditions at Andersonville prison, I beg to submit the following evidence of an eye witness, who was clearly speaking with the utmost sincerity.

While a passenger on a train approaching Andersonville on last Saturday, I fell into conversation with an elderly man, who evinced great interest in the new monument to Major Wirz. A few questions disclosed the fact that he was for several weeks on guard duty at the prison in the summer of 1864, when conditions were at their worst. In reply to my questions, he said:

If they was badly treated, I didn't see it. They drawed their rations just like we drawed ours, and they was the same rations. We was just as much prisoners as they was, because if we went outside the lines we was court-martialled; and we had to work for our rations.

His description of the rations was quite enough to explain illness, but he had no complaint to make, as he said they knew they received the best the authorities could furnish.

I submit that evidence of this sort, given by a man whose speech showed that he was a Southerner, and without the least idea that it would ever be printed, should have great weight. If prisoners and guards received exactly the same rations, there can at least be no truth in the contention that the prisoners were starved. Any soldier in any of the Southern armies could explain why medicine was not to be had for the prisoners. W. D. HOOPER.

University of Georgia, Athens Ga., May 26.

SOCIALISM.

TO THE EDITOR OF THE NATION:

SIR: Your amusing dissertation (see *Nation*, May 27) on the parlor Socialist recalls a hectic warning against Socialism, entitled "The Coming Peril," which came to my notice a few days ago.

Socialism has truly lost much of its ancient barnyard ferocity, and tamed down to a suitable playfulness for the parlor. Its fangs have been drawn, its sting removed, and what was once honest, if forceful, protest, has degenerated into a species of windy discontent with oppression, monopoly, confiscation, etc., as maltreated bywords.

Though not disposed to apologize for the injustices of the economic system, I yet fail to see how the good of the cause is served by calling things out of their names. Monopoly and confiscation are relative terms, and applied indiscriminately promise no solution.

Specific gravity counts in the economic as in the physical world. Conditions cannot be overcome by theories, nor is virtue attained through vociferous condemnation of successful brigandage. W. S.

Philadelphia, June 2.

THE HANGING OF PLANTS.

TO THE EDITOR OF THE NATION:

SIR: It may not be too late to submit the following quotation apropos of the recent discussion in your correspondence column in regard to the hanging of animals. The passage is found in the work attributed to one Meister Stolle (thirteenth or fourteenth century), reprinted in Von der Hagen's "Minnesinger," vol. III, p. 5:

A king rode before the house of a good man who dwelt by the forest, and who suffered many sorrows without desert. A garden lay by the house, in which he had erected a gallows. The king said: "Good man, tell me, why have you erected this?" He said: "Full many a day the tall weeds have destroyed my good crops; these I pull out with my hands and hang them upon the gallows, that they may wither there."

B. Q. MORGAN.

University of Wisconsin, May 26.

Notes.

After a silence of six years, James Lane Allen has written a new novel, "The Bride of the Mistletoe," which will be issued by the Macmillan Company at an early date.

Little, Brown & Co. have ready for immediate publication a new work by Admiral A. T. Mahan, entitled "The Harvest Within: Being Thoughts on the Life of a Christian." This is a striking departure from the topics usually considered by our naval writer.

Nathan Haskell Dole has made a translation of Baroness von Suttner's "Memoiren," which will be brought out by Ginn & Co. The book, in its German form, was noticed in the *Nation* of February 18.

Calmann-Lévy announce a new work by Anatole France, to be called "Les Sept Femmes de la Barbe-Bleue, et autres contes merveilleux."

The Sturgis & Walton Co. announce what they describe as an important book of travel to be published in the autumn. It is an account of "The Great Wall of China," by Dr. William Edgar Geil.

Buxton Forman is editing a volume of letters of Edward John Trelawny. He would be glad to have any letters of Trelawny's sent to him for inspection, at No. 46 Marlborough Hill, St. John's Wood, London.

"Burdett's Hospitals and Charities" (the Scientific Press) comes to us for the year 1909, with its full statistics regarding English and Colonial charitable institutions, with a chapter on American hospitals. The expenditure tables have all been remodelled in order to bring them into line with the Revised Uniform System of Accounts. In its own field the book is indispensable.

One may fairly ask whether Alexander J. Philip did not fall between two stools when he refrained from making a Dickens encyclopædia or a Dickens concordance out of his "Dickens Dictionary" (E. P. Dutton & Co.). The compiler himself laments the difficulty of separating the characters and places dealt with by the novelist from merely casual allusions. This will probably be felt still more keenly by the reader, who may be counted upon to consult the volume for just those less familiar scenes and persons which Mr. Philip omits. Barring this defect, the dictionary is admirably wrought. Under the leading titles appear the chapter reference, followed by a brief description which, in the case of more important characters, is amplified by a note about the plot and setting. When possible, conjectures are added as to the historical personages who may have served as models. Dickens's own descriptions are closely followed throughout. The synopses of his works, in the introduction, are not uniformly good, though doubtless serving well enough what little purpose they have. It is to be hoped that the work will soon grow into a Dickens encyclopædia, as Mr. Philip plans.

Prof. Eugen Kuehnemann of the University of Breslau, who was exchange professor at Harvard from 1906 to 1908, has written for the *Deutsche Rundschau* a study of ex-President Eliot, which has been translated by Dr. A. W. Boesche of Harvard University, and published by Houghton Mifflin Company in a thin volume of eighty-five pages. The writer has tempered his admiration for Harvard's great president with a sufficient measure of judgment. He is interpretative rather than critical, but will undoubtedly give his German public a very adequate idea of what Mr. Eliot stood for and accomplished. To us, naturally, the little essay brings little that is new. If Prof. Eugen Kuehnemann errs anywhere it is in laying somewhat exaggerated emphasis on President Eliot's devotion to the cause of American democracy. Mr. Eliot's influence on public life has undoubtedly been notable, but, after all, it is something of a commonplace that the speeches of university presidents shall insist upon the close connection between college and country. The German reader is a bit in danger of drawing wrong conclusions concerning the aristocratic tone of the average American university other than Harvard.

"Civics and Health" (Ginn & Co.), by William H. Allen, secretary of the Bureau of Municipal Research, is not the systematic treatise which the title might lead some readers to expect. It is, however, most interesting reading, well calculated to draw attention to the exceedingly varied efforts now making to bring about a general social betterment by beginning at the bottom. The central theme of the book may be said to be that health is a right which every member of the community may properly claim, and that the most important element in the health of the community in the broadest sense is the child. The preface, by Prof. W. T. Sedgwick, intimates that the author is a prophet, but of a very practical type, albeit crying in a social wilderness. Much of his message seems to us rather vague, as, perhaps, befits prophecy, and some of his views and suggestions, mostly little suited for quotation, will not bear rigid inspection at short range; but the book as a whole can hardly fail to awaken the sympathies of even an apathetic reader. Now and then he may feel that he hears too many of the pet phrases of the settlement worker, or he may find the trend of method altogether too socialistic, the system too paternal to be quite acceptable; but the more he reads the better he will recognize that the preacher sincerely desires to reduce these evils to the lowest possible limit. It is an unexpected pleasure to come upon a thoroughly rational attitude towards alcohol and tobacco, and the mere expression of such views will create confidence in the writer's position regarding other very debatable questions. The book is well printed, and has a number of excellent pictures, whose precise relation to the text is not always obvious.

Dodd, Mead & Co. have just issued the "New International Year Book" for 1908, the second in their new series of annual volumes edited by Frank Moore Colby. In 1902 both the "International Year Book" and its senior, "Appleton's Annual," suspended publication. Their simultaneous disappearance was presumptive evidence that there was no demand for works of that character. Yet it is hard to see why the journalist, the student of contemporary politics, and the large number of college teachers whose interests lie in the yearly progress of the social and natural sciences should fail to recognize the large utility of an annual cyclopædia, provided it shows tolerable fulness and a high standard of accuracy. If history, for instance, is to go on being written in large part from newspapers, as it has been done by Mr. Schouler and Mr. Rhodes, a reliable annual compendium is both a valuable guide and sub-

stitute. The latest "International Year Book" is a handsomely printed volume of 776 large pages. It appears exceptionally strong in gazetteer matter and politics. Perhaps as valuable a feature as any is the summary of events accompanying the separate articles on the States and Territories Local politics and legislation are badly neglected in nearly all books of reference, in spite of the fact that Alexander Johnston in "Lalor's Cyclopædia" showed what admirable work can be done in that field. In the present volume the State summaries have been intelligently prepared. Here, if anywhere, error by writer or proofreader should be rigidly guarded against. Those we have noticed are of the second kind. Under Louisiana, the difference between 63,000 votes and 12,000 votes should give a majority of about 50,000 and not 40,000 as stated. Under New York, Shearn's vote for Governor is given as 33,994. This was approximately Shearn's vote in New York city; in the State it was over 43,000. Foreign statistics and politics receive very satisfactory treatment. The biography strikes us as comprehensive, but overcondensed. About 1,400 words for Grover Cleveland is not enough; or if that is enough, 800 words for Senator Allison is too much. Campbell-Bannerman and Charles W. Eliot are treated very summarily. But as a whole, the book easily demonstrates its value as a work of reference.

"Woman Through the Ages," by Emil Reich (E. P. Dutton & Co.), may interest those who are in search of facts about women dissociated from the political, social, and literary movements of their times. The "gallons" of information, poured (to use the author's own figure) into the "pint measures" of two handsomely printed and illustrated volumes, include all types of "western" women from the mothers of Egypt and the matrons and commendable *hetaræ* of Greece to the "Amazons" of America, in whom is all guile, and who have not yet found their Theseus in the "American male Cinderella." The clearest thread in the maze of biographical and descriptive material is the author's theory, already advanced in a previous work, that imperialism affects disadvantageously the position and character of woman. Upon this thread are strung specimens as diverse as the women of Athens, Sparta, Rome, and England. Although first-hand sources have been drawn upon, readers familiar with other compendia of the history and literature of classical antiquity, the middle ages, and the renaissance, and of France and England in the following centuries, will find little that is new in this book. Dr. Reich's opinions, however, are often sufficiently unprecedented, as when he asserts (inconsistently with some of his other conclusions) that it was the failure of the Greeks to develop their women which proved their ruin, or that "in the renaissance the personality of women was as yet nebulous." His knowledge of sculptured beauty is less exact than his observation of the beauties of living women, if we may judge from his failure to distinguish from Pentelic the Parian marble of the Venus of Melos. His literary preferences may be seen from his attributing to Mrs. Browning a "beauteous power of song" and to George Eliot "feeble didacticism and verbosity." His moral preferences are not always so well defined, but in general they tend to exalt the mother of the Gracchi above George Sand. The feminism of the nineteenth and twentieth centuries is always an abomination to him. Since Dr. Reich disclaims having written a "history of woman," we cannot perhaps complain of his special pleading and fitful arguments. But even those who agree with him will find his entire treatment vitiated by a style at once feverish and bloodless. It is not in this way that the "few Englishmen" at whom his preface is aimed will be disabused of a *chinoiserie d'idées* about "the rôle of woman in social and historical life."

Prof. Otto Ritschl has undertaken an exceptionally difficult task in a large history of Protestant theological thought, "Dogmengeschichte des Protestantismus: Grundlagen und Grundzüge der theologischen Gedanken- und Lehrbildung in den protestantischen Kirchen." Vol. I has the special title, "Prolegomena: Biblizismus und Traditionalismus in der altprotestantischen Theologie" (Leipzig: J. C. Hinrichs). The author correctly feels that he is supplying a desideratum, as the theology of the early Protestant fathers has been grossly neglected in favor of the theology of the middle ages and earlier periods; or, even worse, has been judged from a wrong point of view. Ritschl has undertaken to furnish a purely objective investigation.

A new book of unusual interest to students of German literature is volume xiv of Suphan's edition of Herder, recently published. This scholarly edition has been for years almost complete. The lack of this particular volume, however, has been felt as a serious gap in the series, as it was to contain the second half of the "Ideen," with the introduction and critical apparatus to the whole work. The first half of the "Ideen," volume xiii, appeared in 1887, and scholars were beginning to give up hope of seeing the work completed in Suphan's lifetime. His duties as director of the Goethe and Schiller Archives in Weimar and supervising editor of the Weimar edition of Goethe have occupied him to such an extent that it seemed as if he would be unable to complete the Herder. But the editing of Goethe's scientific writings has put him in possession of a rich fund of material bearing on Herder's relation to Goethe. The matter of chief importance is the manuscript material which Herder left, and which throws new light on the history of the composition of the work. Volume I of the edition, we may add, was published in 1877, and reviewed in the *Nation* of May 30, 1878. The concluding volume will probably appear in 1910.

That modern English literature interests the Germans more and more, keeping pace with their study of the current English language, may be shown by a new and voluminous work, "Die englische Literatur im Zeitalter der Königin Victoria," by Dr. Leon Kellner, professor in the University of Czernowitz (Leipzig: Tauchnitz). In the characteristic style of the *Forscher* who is determined to sweep the forest and thus overlook no tree, bush, fern, or even moss, Kellner begins with a general view of literature at the dawn of the Victorian era, seeks to outline the chief characteristics of English poetry, fiction, history, and drama, as they gradually developed, and treats the leading writers, one by one, beginning with Dickens, Bulwer, and Mill, and passing through Carlyle and Thackeray to Kipling, Yeats, and Bernard Shaw. About these he groups various persons of greater or less fame, in England and America, whose lives and work were influenced by the authors especially considered. Thus Emerson and Longfellow, in their relations to Carlyle and Tennyson, are noted. German criticism, as well as English, is presented in compendious footnotes, though the work, as a whole, is historical rather than critical. Bernard Shaw comes in for a disproportionate discussion, a bias that may be explained by the frequent presentation in Germany of Shaw's plays, and several translations into German of his leading works.

The latest addition to the series Der alte Orient, published for the Vorderasiatische Gesellschaft, by J. C. Hinrichs of Leipzig, is an instructive brochure by Dr. Arthur Ungnad, entitled "Die Deutung der Zukunft bei den Babyloniern und Assyrern." It is exceptionally rich in new material from cuneiform sources.

A valuable work on the same general subject, although of an entirely different character, is V. Unruh's "Leben mit den Tieren" (Stuttgart: Franckhsche Verlagshandlung). It is a thorough psychological study of the lower animals, with excellent suggestions as to man's relations to them, and his proper treatment of them in order to develop their most useful qualities through domestication.

One of the best studies of America published in Germany is Dr. Paul Darmstaedter's "Die Vereinigten Staaten von Amerika: Ihre politische, wirthschaftliche und soziale Entwicklung" (Leipzig: Quelle & Meyer). In less than 250 pages the author gives a clear and comprehensive survey of the subject, showing thorough knowledge and just appreciation.

Students of philology and of history, especially readers of Livy, will be interested in the new work of Wilhelm Soltau, entitled "Die Anfänge der römischen Geschichtschreibung" (Leipzig: H. Haesel). The special purpose of this book is to show that all vital and individual features in the oldest Roman history are based on literary invention, and not like myth and folkfore, on a foundation of facts. The author asserts that no credence can be given to reports except those written contemporaneously with the events themselves. The details of this rather radical claim are developed on the basis of the oldest records, such as the Roman dramas, Ennius's "Annals," etc. The same house has also published an interesting biographical work by Dr. O. Th. Schulz of the University of Leipzig, entitled "Der römische Kaiser Caracalla: Genie, Wahnsinn, oder Verbrechen?" The writer, who is already known as the author of several larger works dealing with the Empire, has here given the latest results of psychological and historical study. In general the outcome of his research is more favorable to the Emperor than had hitherto been his lot at the hands of modern historians. In this respect he follows largely the lines of research already pointed out by Leopold von Ranke. The work is written *sine ira et studio*.

The "Weltgeschichte seit der Völkerwanderung," by Dr. Theodor Lindner of the University of Leipzig, which is to be completed in nine volumes, has now reached the sixth. This volume treats of the Modern European System of States, of Absolutism and Mercantilism, of Emancipation and Independent Thought, and of Asia and Africa. The work is largely a history of civilization. Published by J. G. Cotta, Nachfolger, in Stuttgart und Berlin.

Notwithstanding the attitude of Germans toward the French, Napoleon continues to interest them, as is shown by the regular appearance of German publications. "Napoleons Schriften und Gespräche," gathered from French, German, and also English sources, and edited by Hans Landsberg (Berlin: Pan Verlag) is the latest volume in the Napoleon Bibliothek. The editor claims for the Emperor no considerable literary ability, but believes that many of his forgotten compositions and interviews are worth reprinting. This is at least true with the account of Napoleon's meeting with Goethe, described by Goethe himself briefly and unsatisfactorily.

Some years ago Eduard von Hartmann set himself to the task of writing a "System der Philosophie im Grundriss," and now he has finished the volume containing the "Grundriss der Religionsphilosophie" (Bad Sachsa im Harz: Hermann Haacke). The clear style and direct address of the author should commend themselves to the reader weary of wandering in the underbrush of German philosophical discussion.

The special value of the fifty-seventh annual report of the trustees of the Boston Public Library lies in the fact that it shows down to the minutest details the nature and extent of the work of the library force. For instance, to deliver a book to a reader in the central library requires the "service of six different persons." The intelligence needed in some positions is shown by a list of the inquiries for information by school-children, 158 of whom came into the rooms of a single branch one afternoon in December. There are kept on file about 375 newspapers in 20 different languages and "nearly 1,700 different periodicals are in daily use." The depreciation of the value of books is such that of the million volumes in the library about 150,000 "are not worth commercially more than ten cents apiece." One cannot read the report without being impressed with the great educational value of the library, not to the city alone, but to all the scholars living within fifty miles of Boston.

According to recently published statistics of higher education in Europe, the universities there number 135, with 224,740 students. Of these institutions, Germany has 22, with 50,432 students; France 16, with 32,211 students; Austria and Hungary 13, with 28,918; Great Britain 17, with 21,614; Switzerland 7, with 6,780; Russia 9, with 20,192; Belgium 5, with 6,207; Italy 20 (not counting the one just destroyed at Messina), with 22,794; Spain 9, with 12,180; Sweden 3, with 4,972; Holland 5, with 3,918; Rumania 3, with 5,007; Greece, the University of Athens, with 2,600; Denmark, the University of Copenhagen, with 1,607; Portugal, the University of Coimbra, with 1,840; Norway, the University of Christiania, with 1,700; Servia, the University of Belgrade, with 700; and Bulgaria, the University of Sofia, with 1,014. The ten universities with the largest bodies of students are: Berlin 14,203, Paris 13,420, Budapest 6,610, Vienna 6,308, Munich 6,109, Moscow 5,790, Naples 4,930, Petersburg 4,651, Leipzig 4,630 and Madrid 4,204.

The French Académie des Inscriptions has announced a number of prizes. The Grand Prix Gobert, 10,000 frs., is divided between M. Delachenal for his "Histoire de Charles V," and M. Caillet for his "Histoire de la Commune de Lyon au quinzième siècle." The Prix Saintour, 3 000 frs., is divided among four, the chief portion going to the Abbé Roussel for his translation of the Râmâyana. The Prix Bordin, 3,000 frs., is also divided, one part going to Edmond Dautté for his "Magie et religion dans l'Afrique du nord."

Dr. Theodor Barth, the eminent German publicist, died at Baden Baden unexpectedly June 2. He was born in Duderstadt, Hanover, July 16, 1849. From his thirteenth to his nineteenth year he studied at the Gymnasium Andrianum, in Hildesheim, and spent the next three years studying law at the universities of Heidelberg, Leipzig, and Berlin, passing his examination as "Doctor juris utriusque," at Leipzig, in 1870. In 1871 and 1872 he was practising law in Bremen, for the next four years was Amtsassessor at Bremerhaven, and from 1876 to 1883 syndic of the Chamber of Commerce in Bremen, bank commissioner of the German Reichsbank, and general secretary of the Deutsche Gesellschaft zur Rettung Schiffbrüchiger. He represented the three Hanscatic cities, Hamburg, Bremen, and Lübeck, in the committee of the Bundesrat which prepared the protective tariff of 1879. Dr. Barth was a free trader, and all through his career he energetically opposed Bismarck's protective policy. He entered the Reichstag in 1881 as member for the constituency of Gotha, and the rest of his life was devoted to the cause of Liberalism. In 1883 he took up his residence in Berlin, where he founded *Die Nation*, a weekly paper, which existed under his editorship until 1907, when the publication was stopped. *Die Nation* was devoted to politics, political economy, literature, and art, and was the organ of the best writers of the Liberal party. Dr. Barth visited the United States in 1886, 1893, 1896, and 1907. In June, 1907, he received the honorary degree of Ltt.D. from Harvard University. He wrote freely and temperately of American affairs, and issued a study of "Amerikanisches Wirtschaftsleben" in 1887, and a book named "Amerikanische Eindrücke" in 1896. His other writings were mostly contributions to *Die Nation* and to German, French, and English reviews.

Col. Alexander Kelly McClure, an intimate friend of Abraham Lincoln, and a well-known figure in journalism, died suddenly June 6, at his home in Wallingford, Pa. He was born of Scotch-Irish stock in Sherman's Valley, Pa., January 9, 1828. His early life was spent on his father's farm. When fifteen years old, he was apprenticed to a tanner, but was dissatisfied, and in 1846 he left. He then drifted into journalism at Mifflin, Pa., and from there went to Chambersburg. From journalism it was an easy step to politics, and as a member of the Republican convention which nominated Lincoln in 1860, he suggested that the Pennsylvania delegates should break away from Simon Cameron of Pennsylvania, and vote for Lincoln. This was done, and Lincoln's name stampeded the convention. In 1868 he went to Philadelphia to live, and took up the practice of law, having been admitted to the bar in 1853. He was chairman of the State delegation to the national convention that in 1872 nominated Horace Greeley for President. In 1873, with Frank McLaughlin, he established the Philadelphia *Times*, with a capital of $50,000. In less than ten years the property was worth more than $1,000,000. In 1900 he retired from the editorship of the *Times*, and, except for articles on politics, from active journalistic work.

From Leyden comes the report of the death of Professor de Goeje, the great Orientalist. He was seventy-three years old.

A GREAT STATE.

Historic Indiana. By Julia Henderson Levering. New York: G. P. Putnam's Sons. $3 net.

The historian of Indiana has a pleasant field. Mrs. Levering exploits it to excellent advantage, presenting in a handsomely printed and beautifully illustrated book of five hundred pages a series of well-written chapters relating the development of the State through all its stages. As to its natural aspect, few American commonwealths are so attractive as a home for men. Scarcely an acre of its area is unavailable for human uses. There are no deserts, no sterile moutain tracts, no irreclaimable swamps. Its sand and gravel are of value, if in no other way, for the making of roads: its water-soaked lowlands abound in peat and fertilizing muck; its stone can be turned into masonry for cities; coal, iron, and petroleum abound beneath its surface, while above thousands of square miles of the most fruitful soil respond to the "tickling of the hoe" with such "laughing harvests" as the farmer rarely sees elsewhere. With such an endowment, Indiana is well compensated for her lack of picturesqueness: if she has no cataracts or snow-capped ranges, she has something better.

The Algonquins of the primeval period appreciated the advantages of the region, clustering numerously both north and south; and the earliest white explorers found it directly in their path as they pushed from the valley of the St. Lawrence into that of the Mississippi. Short portages at the headwaters of the Wabash and the Kankakee, opened an easy way for them to the Great River, and the trading posts were among the earliest established. The French knew it well, and their English successors saw here no less a land of promise. No episode of the Revolution is more memorable than the winning upon Indiana soil, by George Rogers Clark, for Virginia and so for the United States, of the great Northwest. Then

followed the settlement, at first an immigration from Virginia and the Carolinas, across Kentucky into the southern area; then an influx from the East across Ohio and by Lake Erie; and last an inpouring of the best European elements—a commingling of various strains into a population now in the twentieth century compact, homogeneous, and organized according to the best Anglo-Saxon traditions. These men had a great and most honorable part in the civil war; and since then, in the Union which they did so much to preserve and confirm, are conspicuous in all the best elements of American civilization.

While in general Mrs. Levering only retells a well-known story, her narrative notes a number of matters which, if ever mentioned, have been forgotten or not sufficiently recognized. Will Kentucky acquiesce in the statement that the "blue grass," her most famous resource, the product which beyond all others has made her rich and attractive, is by no means indigenous, but borrowed from her northern neighbor? Here we are told that Kentucky soldiers, returning home from Tippecanoe, carried with them the seed of what their horses had fattened on in the campaign. It is disquieting to read that in 1811 Indiana, like the Central West in general, was shaken by a terrifying earthquake. Had there been cities built of masonry the catastrophe might have assumed almost Sicilian proportions. The scattered backwoodsmen, indeed, suffered little except from panic, but rivers were turned from their courses, bills were swallowed, and habitable fields transformed into morasses. It is startling to say that for a decade or more in the twenties and thirties of the nineteenth century the centre of light and leading in America was not in any Atlantic city, but in the little town of New Harmony on the Wabash. Here came Robert Owen, accompanied and followed by many of the best scientists, educators, artists, and sociologists of the time. McClure, Le Sueur, Say, Rafinesque, Fanny Wright, and the younger Owens were members of the community, while Audubon, Prince Maximilian, the painter Bodmer, and many a scientific traveller, went and came, finding at New Harmony their most congenial atmosphere. Extravagant though the socialism may have beeen into which the enterprise fell, and of which it finally perished, it is well to have the fact brought out that many of our best and most advanced ideas as to schools, industrial methods, social reforms, and, in general, the higher moral and intellectual life, were for the first time in America voiced and put into practice at New Harmony.

We have read with particular interest Mrs. Levering's portrayal of conditions in Indiana during the civil war. The State, though for the most part devotedly loyal, contained a reactionary element which, in 1863 and 1864, became powerful and dangerous. One reads with bated breath of the struggle in those dark days of Gov. Oliver P. Morton and his supporters against the opposition, bearing in mind what would have happened had the administration failed. The strait was greatest in May and June of 1863, during the despondency after Chancellorsville. The Georgian soldiers, Longstreet and E. P. Alexander, have criticised their great Virginia captain, Lee, because he did not at that time, instead of advancing into Pennsylvania, unite with Bragg in Tennessee and advance swiftly to the Ohio. Scarcely a day's journey from Richmond by a good unthreatened railway lay the troops of Bragg. Leaving a force in Richmond to face the disheartened Federals, Lee, by the middle of May, having combined with Bragg, might have rushed for Cincinnati or Louisville. Grant's hold, just then tightening around Vicksburg, could scarcely have been maintained: with fire and sword so threatening their homes, his Western troops would not have kept to their task. On the Federal side at the moment disaffection at the heart was not less a peril than the foe outside. While Vallandigham was a power in Ohio, Voorhees, as earnest and probably more eloquent and able, was a power in Indiana. Had Lee, after reaching the Ohio, which he might have done with small opposition, pushed with his usual swiftness and force for Lake Erie, thereby sundering the East from the West, crowds of dispirited men in the Central West would have opposed no hindrance, and many would have helped. As one reads Mrs. Levering's account of these gloomy days of the Copperhead majority in the Legislature, disloyal secret societies importing arms and drilling by night, a monotonous tale of humiliation coming in meantime from the Federal armies, one can see that the chance for success just before Vicksburg and Gettysburg had become very narrow. Had Lee's strategy been only a little better, or Grant and Meade only a little less able in the summer of 1863, the "Lost Cause" might have been that of the Union and not the Confederacy.

CURRENT FICTION.

The Cords of Vanity. By James Branch Cabell. New York: Doubleday, Page & Co.

We are prepared for something unusual by the legend upon the flyleaf: "All rights reserved, including that of translation into all foreign languages, including the Scandinavian"; and we close the book, which is—fortunately—a rather unusual work, with a disposition to ponder upon the singular perversity of Scandinavians and others, who need a trespass-warning to keep them from so sterile and malodorous a field. One is reminded of the time-honored characterization of this class of fiction as worse than immoral—dull. This high-attenuation of Don Juan is worse than a rake—a cad. It is strange that a practised writer like Mr. Cabell should have used the first person. This narrative, told by an outsider, would be sufficiently cheap and sickly; when the principal character complacently smirks his way through the recital of his own misdeeds, the effect is revolting. In the Epilogue, for example, Gillian Hardress, a past Incident in the career of young Mr. Townsend—he is only twenty-six, but he began early—in her dying delirium reveals to her husband the whole ugly story of their entanglement. When she recovers her senses at the last, she lies to shield the real culprit. Townsend hears Hardress's story, and lets him go out to kill an innocent man, Townsend's own close friend, while Townsend himself is left in the pleasant sunny garden, languidly debating whether he need tell his fiancée or no. "For it would make her so unhappy; and never in my life have I been able to endure the contact of unhappiness."

The Seven Who Were Hanged. By Leonid Andreyev. Translated from the Russian by Herman Bernstein. New York: J. S. Ogilvie Publishing Co.

The chieftainship of Russian letters is an office of precarious tenure. In a country where art bases itself so consistently on the temper and the opinions of the hour it is inevitable that, as temper and theories change, the reputation of the artist should change with them. For some time Andreyev has disputed first place among the younger Russian writers with Gorky. Our translator assures us that Andreyev is more popular now than Gorky or Tolstoy. If that is the fact, it is because Andreyev is so intensely preoccupied with the topics of disease, madness, and death which appeal particularly to a people that has recently passed from a state of high expectations into the relaxation of defeat and discouragement. It must be noted, however, that Andreyev's predilection for the abnormal and the horrible carries with it almost nothing of that delight in physical depravity which is the hall-mark of the naturalistic school. His concern is entirely with psychical processes.

Compared with Gorky's full-blooded people, Andreyev's figures hardly live. They are most often true, but only as the embodiment of true psychological states. He more than suggests Dostoievsky in his choice of subjects; he suggests Turgenieff in the minuteness of his vision. The girl Musya, arrested with four fellow-terrorists while plot-

ting the death of a Minister, is being tried for her life. The verdict is predetermined. Instead of looking at the judges, she watches a bit of blue sky visible through one of the windows of the gloomy courtroom:

When the sky had darkened, Musya calmly, without lowering her eyes to the ground, turned them to the corner where a small cobweb was quivering from the imperceptible radiations of the steam heat, and thus she remained until the sentence was pronounced.

Now, this is a method more adapted to the short story than the novel. What Andreyev tries to do in the present book, is to study the separate souls of five men and two women—the five terrorists are reinforced by two common assassins—who are being sentenced to be hanged, who are waiting to be hanged, who are being hanged. There are paragraphs and sentences that are so real as to be a torture; but there are long passages in which the pace is forced. The sense of the inevitable is absent. It is very likely that the thought of death may have affected this man in the manner described; but it would have been equally natural for him to have been affected in a dozen different ways. It is the case of a highly gifted artist drawing up a tentative list of psychological states, and then selecting one as best suited to his purpose. With this proviso, we can not deny Andreyev an exceptional talent for seeing the truth. The last chapter, which describes the midnight summons to execution, the ride in the dark, the mustering of the seven victims for the approach to the gallows, their removal two by two, is excruciating reality and high art in its kind.

Sebastian. By Frank Danby. New York: The Macmillan Co.

If in her earlier novels Mrs. Frankan's realism came rather strong upon the palate, making a pretty deliberate appeal to the inquisitive, not to say prurient, mind, she seems now to have taken second thought. "Sebastian" is not in all respects a "pleasant" story, but it is perfectly wholesome. It opens a little ominously, with its novelist-heroine uncongenially married to a plain man. We reflect ruefully that we are once more to have the everlasting "temperament" analyzed, at the expense of all practical virtue and common sense. Once more we shall find ourselves called upon to admire or tenderly condone faults which would be pronounced gross in grosser natures. But nothing of the sort happens. The lady novelist is not a disagreeable idol set up for us to worship, but a rather pathetic figure. She is the daughter of a great English stylist whose memory she adores, and possesses a refined little talent of her own, which has its audience. The plain man whom circumstance has allotted to her loves her devotedly and unselfishly; but he has nothing in common with her, least of all love. She becomes a mother, but remains absorbed in the bookish life, and ignorant of all deep experience. In her son she sees only his grandfather; her ambition for him is a manifestation of personal vanity. But he has also something of his father in him. There is a bond between the two which the mother cannot understand, and of which she is meanly jealous. The action progresses toward her enlightenment. Gradually she learns her lesson, sees what it is she has lightly scorned, and what it is she has childishly pursued. She writes her finest novel, but its remarkable success no longer seems to her the final triumph. She has begun to live.

There are one or two curious locutions in the book, such as: "It struck him, that his mother had stood between him and at what he ought to look."

Irresolute Catherine. By Violet Jacob. New York: Doubleday, Page & Co.

"Black Heber" this might properly have been called, for it is the stark figure of a man which rescues the tale from its otherwise rather colorless character as a bit of English rustic *genre.* Catherine is a pale wraith of womanhood, and the three or four other human figures that count in the narrative, while clearly enough cut, are altogether subsidiary to that of the wild shepherd-sectary. The theme is the primeval one: the vying of two men of different character for the favor, or rather for the person, of one woman. The opening scene, with its picture of an open-air baptism in a remote county, is both striking and touching: the luckless Catherine, with so pure an intention, comes so sadly out of it. Sadly, indeed, she comes out of every situation for which her own feeble initiative is in any way responsible. But Black Heber makes a heroine of her by mating her with himself—a very proper hero. The flavor rather than the substance of the tale, gives it unique merit. Indeed, the work as a whole has a restraint, compactness, and finish which mark it for a bit of literary art, as distinguished from the amusing catchpenny fiction of the popular book-mart.

The Russian Army and the Japanese War. By Gen. Kuropatkin. Translated by Capt. A. B. Lindsay and edited by Major E. D. Swinton. 2 vols. New York: E. P. Dutton & Co. $7.50 net.

Of the four volumes into which Gen. Kuropatkin has cast his narrative of the war with Japan, only the last has been drawn upon for the material which is now given to the English reader in an excellent translation by one British officer and under the editorial supervision of another. The first three volumes of the entire series deal in detail with the three great battles of Liao-Yang, the Sha River, and Mukden. In his final volume, Gen. Kuropatkin presents his apologia in the form of a comprehensive investigation into the causes that led to Russia's defeat. Books written by unlucky military commanders for their own vindication make, as a rule, unpleasant reading. They blend denial with recrimination, and after shifting the main responsibility for defeat on their opponents at home, attribute the rest to fortune. Enough has been made known of Gen. Kuropatkin's personality and of his previously expressed views on the Japanese war to prepare the reader for a different sort of defence. The Russian commander-in-chief has more than once admitted that he was unequal to the task imposed upon him. And he strikes the same note of manly frankness in his introduction to the present book, when he writes:

I have been so intimately connected with the important events in the Far East and have been so largely responsible for the failure of our military operations, that I can hardly hope to take an entirely dispassionate and objective view of the men and matters that I shall deal with in the present work.

But the author of these memoirs is something more than a plain, blunt man, devoid of wit or utterance. The first impression, indeed, is that Kuropatkin was too much of a philosopher and historian to have made a successful general. He begins with a long account of the history of Russian expansion, which at first sight would seem to be going rather far back for an explanation of the war with Japan, but which the writer, in fact, turns very cleverly to his own uses. He shows, and his contention is not far from the truth, that in every war of aggression that Russia has waged since the time of Peter the Great, she has begun hostilities with insufficient troops, with poor equipment, and under mediocre command; that she has been compelled to augment her forces and train her officers and men under fire, and that victory came to her only after years of defeat. In no war that Russia fought between Poltava in 1709 and Port Arthur in 1904, has the fleet been of service to her. The implication is obvious. The war with Japan ran its natural course—for Russia. When the General states, with a seeming interest in statistics as such, that Russia's efforts to reach the Black Sea cost her 750,000 lives out of 3,200,000 men put in the field against Turkey, and that the approach to the Baltic cost her 700,000 lives out of 1,800,000 men employed against Sweden, he creates the presumption that Russia had no reason to expect such important results as a victory over Japan would have brought, at so comparatively small an outlay as the fight-

ing had cost her when peace was signed in September, 1905. The conclusion of peace was a mistake, however threatening was the internal situation that really forced the Czar's hand. Only after Mukden was the Russian army numerically strong enough to meet the enemy with a fair chance of success. Had the war gone on after Mukden, the outcome would in all probability have been different from what it was.

When we come down to details, Kuropatkin's explanations are more or less familiar. He was opposed to the war. It was brought on by the foolish policy of Witte, whose insistence on building the Siberian railway through Chinese territory was the beginning of the fatal policy of Manchurian adventure. It was hastened by Viceroy Alexeieff, Privy Councillor Bezobrazoff, and the rest of the camarilla that went light-heartedly at the seizure of Manchuria in the belief that Japan would not dare to go to war. Kuropatkin, on the other hand, was so impressed with the possibility of war that he advocated the abandonment of Port Arthur, the sale of the Chinese Eastern Railway, and the concentration of Russian interests in northern Manchuria, where Japan would not dare to antagonize them, and would not care. But Alexeieff, in spite of the Czar's repeatedly expressed desire for the maintenance of peace, persisted in his policy of unarmed bluff till the break came.

To the Japanese, Kuropatkin concedes pretty nearly all the virtues claimed for them by their admirers. They had prepared for a long time, and thoroughly; they entered the contest with an intimate knowledge of the terrain the war must be fought on, with full appreciation of the magnitude of the task that confronted them, and with a fanatical devotion that made the common soldier an ideal instrument in the hands of their highly-trained commanders. With the Russians it was all the other way. The men with the colors fought well, but the reserves were poor material as a whole. Many of them had been away from the colors for nearly twenty years, had forgotten their training, and did not even know how to use the new-pattern rifle. They were unsteady under fire, and broke ranks at the least excuse. The commander-in-chief frequently saw a wounded soldier escorted to the rear by ten sound fighting men. Partly responsible for this was the wretched auxiliary organization which forced combatants to do the work that should have been done by the medical corps. The officers showed lack of training and inability to preserve discipline.

But, above all, it was the utter lack of preparation that brought defeat. Russia began the war with a ludicrous conception of the actual and potential strength of the enemy. Kuropatkin admits that he himself, in estimating Japan's war strength, had failed to take into account her splendid facilities for developing her second line of battle; and it was the Japanese reserves who took Port Arthur and struck the decisive blows at Mukden. The General quotes from a report by a Russian military attaché, who was present at the manœuvres of the Japanese army shortly before the war. No less than fourteen capital defects were enumerated by this expert, among them being: a hard and fast, inelastic form of attack independent of local conditions; the absence of proper flank protection; the absence of a definite object in attack; the disbelief in cold steel; the inclination to avoid enclosed and, particularly, hilly ground; the inclination to use direct frontal attacks without turning movements; the tendency to retire too rapidly; the disinclination for night operations. Now, if a military critic were asked to enumerate the technical reasons for Japanese success in the war that followed, he would mention their excellence in precisely those features that the Russian expert found them so deficient in. This specific case symptomatizes Russia's general preparedness for the war.

Thus Kuropatkin illustrates in detail the general principles he lays down at the beginning. Russia should never have engaged in the Manchurian adventure; once engaged, she should have done her best to avoid war; with war unavoidable she should have prepared; forced into war without adequate preparation, she should have held the field till time and training and her immense resources in men turned the scale in her favor. None of these things she did.

Modern Accounting: Its Principles and Some of Its Problems. By Henry Rand Hatfield. New York: D. Appleton & Co. $1.75 net.

Within the limits that he has marked out for himself, Professor Hatfield has produced the best treatise on accounting that has yet appeared in the United States, and it is difficult to find its superior in the English language. It is not a book on technical bookkeeping or auditing. Its pages are not filled with accounting forms, or with detailed instructions as to how to enter this item or that. Such statistical and accounting details as are found within its pages are designed to illustrate the argument, and all reference to the bookkeeping art has been relegated to one brief concluding chapter entitled, Technical Improvements in Accounting Practice.

Neither is this a book on the philosophy of accounts, which would be likely to carry the reader into endless and often fruitless speculation. It strikes a happy mean between the extremes of the theoretical and the practical, and presents what might be called a comparative study of accounting practice rather than any dogmatic scheme of the author's own. It is unusually free from newly invented terminology, and employs, in the main, designations that are current in the best accounting and business procedure.

The book is quite complete in its discussion of the unsettled problems of the science. Both sides of the case are clearly presented, and usually the author's own opinion concludes the discussion. Only occasionally does he dismiss the subject without comment after the evidence is all in. A characteristic feature of the work is the frequent quotation from decisions of English and American courts, from the commercial codes of Germany, France, and Austria, and from the commentaries of leading jurists. In fact, if one general criticism were to be passed upon the treatise as a whole, it would be that the author shows himself a little too ready to accept the best current practice and the decisions of the courts as final, instead of basing his conclusions upon fundamental financial and economic principles. Yet the book is written as a working manual, and this is possibly a sufficient justification of the method employed.

But the impression should not be created that the author always agrees with the courts or with the accountants. For example, in one of his best chapters, that on Depreciation, he comes out flatly in opposition to American court decisions, and demonstrates in a convincing manner that depreciation is properly an expense, and that profits are not correctly stated until an adequate charge against gross earnings has been made to cover wasting assets. This is significant in view of the hostile attitude assumed by the railways toward this identical theory when issued in the form of an order by the accounting division of the Interstate Commerce Commission. Furthermore, he urges accountants to transcend the limits under which courts labor, and says in connection with a discussion of profits:

> For a more perfect rationalization of the legal dicta concerning profits it will probably be necessary to await the day when the growing dignity of the profession of accounting shall cause its principles to permeate the ranks of bench and bar.

As for the accountants, he boldly risks the condemnation of the entire profession by taking the reasonable attitude that there is no objection, in the case of wasting properties, such as mines, to the distribution of the entire earnings in dividends without any reserve for depreciation, provided only there are no creditors to be injured.

But what impresses one most favorably with this book is the high ground it takes with reference to the function

of accounts, and the duty of the accountant—a constant reiteration in one form or another of the sound principle that the purpose of accounts is to reveal the truth, not to conceal it. This is the author's guiding principle in all the rulings he makes concerning disputed questions of practice. For example, he frowns upon the common practice of charging discount on bonds to construction or capital account; he insists, in the face of weighty accounting and legal authority, that undervaluation of assets, and the establishment thereby of a secret reserve, fall far short of the ideal standard of accounting; that goodwill may properly be included in the inventory only at its cost, and that if it costs nothing, it cannot be included at all; that if stock is paid for in property at an inflated value, the inflation should be clearly shown in the accounts. "Conscious misstatement," he says, "which exists all too often in corporation finance, which indeed has been characteristic of American finance, is an outrage to the principles of accounting."

The book begins with a lucid treatment in two chapters of the principles of double-entry bookkeeping. Then follows a chapter on the balance sheet, out of which grow the succeeding chapters which treat of the individual items of the balance sheet and the problems suggested by them. If any chapters were to be selected for special commendation, they would be those on Depreciation, Profits, and Surplus and Reserves.

The Poetical Works of John Dryden. Cambridge Edition. Edited by George R. Noyes. Boston: Houghton Mifflin Co. $3.

After Johnson, Malone, Scott, Lowell, Collins, Christie, and Beljame, it should seem that, without the discovery of new material or the possession of extraordinary critical powers, an editor of Dryden can scarcely hope to surpass previous accomplishment except in the matter of bibliographical and textual exactness. Herein, at any rate, lies the importance of the "Cambridge Dryden," which "seeks to justify its existence" by its volume, by its carefully collated text, by its chronological arrangement, and by its reproduction of many of Scott's notes. The basis of the book is a text which has cost years of labor and which deserves unqualified praise. In the case of the Virgil the textual improvements are particularly frequent and significant. The chronological arrangement is an advantage, although it is necessary to remember, in using the book, that the texts are arranged strictly by date of original printing, not by date of the corrected editions which very properly form the basis of the present text.

Scott's notes, although usually omitted when inaccurate, are often quoted (p. 521, l. 20; p. 751, l. 131, etc.), when they are in nowise distinctive. To many these notes will be most valuable when (as on p. 392, l. 417) they tell most about Scott. His inaccuracies, it may be remarked, have not always been so discreetly dealt with; for instance, Ker ("Essays of John Dryden," 1900, II, 244, l. 27) relies upon one of Scott's notes, which, in three lines, contains three outrageous blunders. The editor's own notes reveal an admirably thorough and even knowledge of various sources of illustration. Perhaps they are a trifle less full than usual in their explanations from contemporary events, and rather more helpful when they deal with Dryden's classical allusions and French sources. The classical allusions, indeed, are over-explained: the reader for whom it is necessary to translate "impar pugna" or "pondere, non numero," or to explain that "the Stagirite" is Aristotle, or that Leander is "the lover of Hero, drowned in swimming the Hellespont," will hardly be able to master the frequent quotations from French critics of the seventeenth century, upon whom, as might be expected from one of his earlier studies, Professor Noyes draws liberally. Most of the notes, however, are judicious as well as learned, and many are really contributory.

The bibliographical notes are admirably careful. For instance, upon a certain passage in the preface to the "Fables," Ker (II, 261, l. 21) has the note:

> James Drake wrote an answer to Collier. "The Ancient and Modern Stages Reviewed, or Mr. Collier's View of the Immorality and Profaneness of the Stage set in a True Light," 1699.

Professor Noyes's note reads:

> Dr. James Drake wrote in answer to Collier a work called "The Antient and Modern Stages Survey'd; or, Mr. Collier's View of the Immorality and Profaneness of the English Stage set in a true light," published anonymously in 1699.

In seven points, two of them striking, Professor Noyes's quotation of this title is different from Professor Ker's; and in every instance the former is correct. The case is typical of the chief strength of the "Cambridge Dryden"—its enormous accumulation of minute improvements upon previous editions.

The Valley of Shadows: Recollections of the Lincoln Country, 1858-1863. By Francis Grierson. Houghton Mifflin Co. $2 net.

The author of this fascinating book of reminiscence, known to English readers by his volumes of essays entitled "Modern Mysticism" and "The Celtic Temperament," and to music-lovers of a former generation by his extraordinary singing and piano-playing in Paris and other European capitals, was born in England in 1848. When less than a year old, his father, a brother of Gen. B. H. Grierson, the noted Union cavalry officer, emigrated to America, and settled on the Illinois frontier; and there the boy, delicately sensitive and keenly observant, grew to manhood. What affected him most was not the material development of the country or its growth in population and wealth, but the spiritual and even mystical significance of the life there led. With a literary charm curiously suggestive of Charles Egbert Craddock and James Lane Allen, he describes for us the restless solitude and vastness of the prairies, its tall grass billowing like the sea; the hard, lonely lives of the settlers, buoyed up by neighborly kindnesses and a firm religious faith; the gloomy forebodings occasioned by the appearance of a comet; the preaching of the unlearned circuit rider and the emotional outbursts of the campmeeting; and the thrilling experiences of the men and women who, in the fear of God, aided the escape of fugitive slaves. No one who reads his pages will soon forget the figures of the author's mother, reading her prayer-book as the slave-hunters approach the cabin door; or of Kezia Jordan, the sweet singer; or of Zack Caverly, nicknamed "Socrates"; or of Elihu Gest, the "Load-Bearer"; while the account of the Lincoln-Douglas debate is a piece of description as valuable as it is altogether admirable.

Unfortunately, our measure of praise must be lessened by the fact that the book, as a whole, does not hang well together. The thread of incident running through the first two-thirds of the volume gives it somewhat the character of a novel, drawing the reader eagerly on to see how it is to turn out; then the story abruptly ends, and the remaining chapters deal for the most part with matters having but slight connection with what has gone before. The three chapters given to Fremont and his experiences, though interesting in themselves, have nothing to do with the rest of the book; and the same must be said of the chapter on Gen. Grierson and his raid. It is matter of sincere regret that a work which makes, in large part, so welcome an addition to autobiographical literature should not have been more consistently carried out.

Science.

The Interpretation of Radium. By Frederick Soddy. New York: G. P. Putnam's Sons. $1.75 net.

The discovery of radium, with its extraordinary property of giving off energy spontaneously, following closely on the discovery of the Roentgen ray and other forms of radiation, has aroused

such a keen interest among the general public, that books on these subjects are eagerly welcomed. To find a parallel, we should probably have to go back to the early part of the last century, when the properties of current electricity were discovered, and wide-spread interest in them was soon awakened. The influence on civilization of the harnessing of the electric forces leads us to wonder whether this radiant energy may not, in turn, exert a profound effect on future conditions of life.

Books on the marvels of science are common enough, for the most part written by persons of unbounded imagination and small knowledge, who turn speculation into fact and hypothesis into theory. But this one is not of that sort. Mr. Soddy was for years associated with Prof. Ernest Rutherford in his important experiments, and with him elaborated the generally received theory of radio-activity. He has recently gone to the University of Glasgow, and now publishes the substance of a series of six popular lectures given there. Although the matter has been worked over and expanded, it still bears the impress of the lecture-room, and in consequence suffers somewhat when read in book form. Still the story of the discovery of the radio-active substances, of the rapid development of both our experimental and theoretical knowledge of the subject, with its momentous possibility of the transmutation of the elements and the existence of atomic energy, is well told. Indeed, the account is in such clear and simple terms that any educated person should be able to learn what has so far been done.

While approval should be given to this first and most important part of the book, not so much can be said of the latter portion where the broader relations of radio-activity to life and character are discussed. It is perhaps unavoidable that one, so immersed in a new and fascinating study, should feel that its possibilities are unlimited, but it is to be regretted when vague hopes are allowed to extend beyond the private study. Darwin has set us such an example of restraint in this matter, that we have little patience with those who give loose rein to wild speculations. And when we remember that Darwin's theory of natural selection has, for the most part, proved inadequate, while his doctrine of evolution has stood the test, we can have little doubt that the same fate is in store for the present theory of radio-activity, which supposes a regular and orderly explosion of the atoms of the elements. What if some atoms do explode with tremendous energy, does it follow that we shall be able to make them do so at our pleasure? Or when we have accomplished this, will the struggle for existence come to an end, as Mr. Soddy seems to believe? Such knowledge, leading "to physical power and dominion over nature," has, on the contrary, in the past, rather sharpened the struggle.

It is with a sensation of the gravest misgiving that we follow the writer, a man who has achieved distinction in the mastery of a difficult subject, when he suggests that the myths and legends of our unsophisticated ancestors are the traditions carried down to them from enormously more remote progenitors, who lived in a state of transcendant happiness and power due to a profound knowledge of radio-activity and the ability to explode atoms. "The mystic symbol of matter, known as Ouroboros —the tail devourer," the philosopher's stone, the elixir of life, existence in the "Garden of Eden," may mean all this, and the "Fall of Man from the Garden of Eden" may symbolize what we quote:

> Possibly they [our happy demiurgic progenitors] could explore the outer realms of space, emigrating to more favorable worlds as the superfluous to-day emigrate to more favorable continents. One can see also that such dominance may well have been short-lived. By a single mistake, the relative positions of Nature and man as servant and master would, as now, become reversed, but with infinitely more disastrous consequences, so that even the whole world might be plunged back again under the undisputed sway of Nature, to begin once more its upward toilsome journey through the ages. The legend of the Fall of Man possibly may indeed be the story of such a past calamity.

A knowledge of radio-activity and the atom is apparently a very dangerous thing.

It is a pity that a book that is in other respects so good, should be marred by such crudities. Nor should we have dwelt so much on them, if there were not the urgent need of emphasizing the supreme importance of sobriety of thought in matters of science. An intelligent man can discount the statements of the made-for-sale books on the wonders of nature, but Mr. Soddy's work bears the stamp of the trained scientific thinker, and he should not permit himself to set so pernicious an example.

Wild Flowers Every Child Should Know. By Frederick William Stack. New York: Doubleday, Page & Co. $1.20.

In this attractive little volume there is condensed a large amount of information concerning the more common plants about which children are likely to ask questions. Here are the answers. The descriptions are accurate as well as readable, the nomenclature is free from caprice, and the illustrations are excellent. The general classification is based on color, like that of more than one popular treatise, and therefore makes a bid for all those who care to move in lines of least resistance. Having decided on the color of the open blossom, one turns to a group of species generally having this color, and then a desultory search begins. It is just at this point that a good many would find a series of simple keys helpful, because the grouping under color is not always free from confusion.

It seems to us a pity that some bold spirit does not go back to the most satisfactory artificial system yet devised, and allow the seeker to count stamens and stigmas, just as his grandfather did, and just as the amateur botanist in Germany or Switzerland can do to-day with his local botany. There seems to be on all hands a fear lest the restoration of the Linnæan system, as an aid, should be regarded as an unpardonable lapse into errors of the past. But we can say to those who dread this reproach, that Garcke and a host of others in Europe are good company in error, if indeed it be error. It may be necessary to state to all who will regard our suggestion as heretical, that in most of the local and general floras on the Linnæan plan there is also a good presentation of the natural system.

The volume which we now have before us was written by one who has studied his plants largely in the field. The descriptions are vivid and clear, and, so far as we have seen, are free from unnecessary prolixity and repetition. Here and there the author has used language which seems to us a trifle too strong, as, for instance, on page 268, in his account of poison ivy:

> Nearly every one is familiar with the unpleasant effects produced by contact with this treacherous and exceedingly poisonous vine, which has undoubtedly caused more harm to mankind than all other plants together.

One suspects that the writer of these lines must have been suffering from incautious handling of poison ivy at the time. Furthermore, some of the definitions would bear recasting: thus, bract is "a small modified leaf at the base of or upon the flower-stem" (p. 393), whereas the bract of Skunk-cabbage or of Jack-in-the-pulpit may fairly be called pretty large. Again, the definition of stigma carries with it a decided ambiguity—"The tip or side of a pistil, through which the pollen is received, by means of tiny tubes which penetrate the style and convey the minute grains to fertilize the seeds within the ovary." The sentence might well be reconstructed, especially the last clause.

But it is hardly right to call attention to the few blemishes in so good and useful a book. It is filled with interesting folklore and old-fashioned herbal hints. The reader will probably be surprised to learn how many of our common plants could be used as domestic remedies, especially in view of the fact that so very few of them are so used. Those to whom the author's medical hints will

come as a surprise, will be grateful that they have escaped so much in the disuse of the herbs.

According to the thirteenth annual report of the New York Zoölogical Society (1908) the society is in a flourishing condition, and is extending its operations in many new directions. The membership now numbers 1,673, and a new class of Fellows has been established to include members who are working zoölogists. The elephant house and the administration building are the latest additions to the Zoölogical Park, while a zebra house and eagles' aviary are planned for the near future. The total number of animals on exhibition exceeds that of any other zoölogical institution, there being 682 mammals, 2,615 birds, and 1,282 reptiles, a total of 4,579 living specimens. In the preservation of wild animals the officers of the society have been instrumental in establishing the reservations for bison in the West, which will probably result in the rescue of these splendid animals from extinction. The society is just entering upon its third field of work, that of zoölogical research. Among the notable results have been those from the experiments in the effect of the environment upon the plumage of birds carried on by C. William Beebe. Other lines of research are at present in full progress. A remarkable item in the report of the director of the aquarium is the attendance for 1908, which was 2,536,147. The national collection of heads and horns has received many valuable accessions, and will find a permanent home in the new administration building. The report of the veterinary shows that the death-rate among the larger animals has been very low. Pneumonia was the cause of death in twenty cases; gastro-enteritis in 15; 10 were killed by cage-mates, 9 died from tuberculosis, 8 from distemper, and 6 from rickets.

The salient feature of the *National Geographic Magazine* for May is the "Call of the West," a description of the work done by the government in reclaiming our arid lands through artificial irrigation. It is a wonderful story of progress and achievement which C. J. Blanchard, statistician of the Reclamation Service, tells, the emphasis being laid not so much on the rich crops raised as upon the development of an ideal condition of rural life and upon the fine types of men and women in these new Western homes. The article is profusely illustrated, as is the account by G. Shiras 3rd, of Frank M. Chapman's "Camps and Cruises of an Ornithologist." Announcement is made that the National Geographic Society intends to prosecute geographical exploration and research, and also to award medals, society and special, for meritorious geographic work.

The death is announced of Bartholomäus von Carneri, author and critic, in his eighty-eighth year. He was a faithful follower of Darwin. Among his works are: "Moderne Faustrechte," "Demokratie, Nationalität, und Napoleonismus," "Sittlichkeit und Darwinismus," "Gefühl, Bewusstsein, Wille," and "Entwicklung und Glückseligkeit."

From Berlin the death is reported, at the age of sixty-five, of Wilhelm Engelmann, professor of physiology in the University. He wrote largely on the subject of muscular and nervous anatomy.

Drama.

Shakespeare and His Critics. By Charles F. Johnson. Boston: Houghton Mifflin Co., $1.50 net.

It is not only as a comprehensive review of Shakespearian criticism in English—a review rapid enough to show the configuration of the whole country without being so cursory as to blur its features—that Prof. Johnson's book is interesting. It is interesting also as a kind of review of English criticism and literary taste in general; for Shakespeare is after all a good deal of a critical touchstone, and in trying him criticism also tries itself.

As a matter of fact, the net result of such a development would seem from Prof. Johnson's survey to consist in a settled disposition to regard the characters of Shakespeare as independent realities in themselves, and to judge them by an application of the standards and criteria of actual life—in a word, to consider them as historic rather than artistic creatures. Such a consummation may not be an unmixed gain. Dramatically, remarks like the following would seem in one sense to be as much the result of a mental confusion as the scholastic objection to the authenticity of the Iliad because Helen calls the roll of the Greeks in the tenth year of the war:

> But Iago is shown plucking the gull Roderigo in a manner which evinces long practice. How is it possible that he can have robbed his victim for years without the knowledge of his fellow soldiers? Such a man soon earns his reputation, yet Iago is called "honest" by all. Again, how is it possible that Iago's malevolence was not called out till he was disappointed in his promotion?

But whether irrelevant or not, this is the sort of question that has come more and more to be put to Shakespeare in one form or another. It is thoroughly characteristic of Dr. Bradley's "Shakespearean Tragedy," which Professor Johnson esteems "the most notable piece of literary criticism that has appeared since the day of Coleridge, Lamb, and Hazlitt." In short, there can be no doubt that the present position of criticism is fairly represented by the author's statement that "Shakespeare's characters are so much like natural products that a certain amount of scientific realism is necessary to their interpretation."

But while this, or something like it, is the upshot of his survey, his volume, though hardly pretending to be more than an outline of other people's opinions, is not without significance of its own. Shakespeare, no doubt, is a subject to kindle at moments even the dullest commentators. But unfortunately he is as heady as he is inspiring. And it is not the least of Prof. Johnson's merits that he should hold the balance of good sense so true, and should apply to each critic so justly his proper corrective. Nor, on the other hand, is there wanting a certain amount of independent criticism, though in accordance with the plan of the book it is necessarily incidental and scattered. Exceptionally consecutive and suggestive, however, is his comment on Hamlet, evidently a favorite subject. And although it is a little difficult to agree with his view that Hamlet at thirty "is a man paralyzed by elemental shame" of woman's frailty; it is impossible to dissent from his thoroughly sane conclusion that Hamlet's "mystery" is his own originality, and has only a speculative or analytic, not an artistic, reality, disappearing very largely in acting or in appreciative reading. "It is impossible to predict how a man of high intellectual qualities and a specially developed emotional nature will act in circumstances that try his soul. When he does act, it is impossible to explain why he did what he did. He did it because he was himself."

The weakest part of the volume is the treatment of eighteenth-century criticism, for whose ideals Professor Johnson has so little sympathy that he misses even the kernel of truth that was in it. Indeed he does the French or classic point of view rather meagre justice. In his sketch of Shakespeare's foreign critics—which is rather incidental to the main issue, to be sure—he dismisses the French, who in the person of men like Stapfer have deserved none so ill of us, in a manner which is hardly less than contemptuous in comparison with his treatment of the Germans. Within his proper English limits, however, his account, without being exhaustive, is thoroughly representative. And while such household names as Rolfe and Hudson are omitted from the roll of living commentators, it is presumably for the reason that they have declined to see Shakespeare steadily and see him whole.

There was practically a new play at the Empire Theatre in this city Monday night, when Sir Charles Wyndham and Miss Mary Moore interpreted "The Mollusc" with the atmosphere and characterization that made Mr. Davies's comedy such a success in London. The performance was at once a vindication of the author, a demonstration, by comparison, of the value of finished acting and a striking condemnation of that managerial obtuseness that gave this city an "olio" in place of a work of art. The comedy has already been seen here in the rough, and no story of its action is necessary. In many aspects it is a gem. In the first place, there are only four characters and one stage setting, a feat of

dramatic construction almost as rare from the author's point of view as it must he precious to the box-office. With this limited field of energy there are no dull moments, no merely theatrical sensations. The action runs along with the utmost simplicity, culminating in a delightfully natural manner at the close of each of the three acts, and the last act is as entertaining as the preceding two. The whole leaves an impression as wholesome and refreshing as the English country garden in which the retired Colorado rancher loved to walk at sunrise—with the charming governess, of course. It was a treat to hear pure English spoken with trained diction by melodious voices. Sir Charles Wyndham and Miss Mary Moore seemed to have discovered at least the signposts to Elysian Fields where heroes laugh at age. For, welcomed as Sir Charles was on hespangled Broadway with a crowded house and multiplied calls it must not he forgotten that here is a player who was at the front in days of long ago, when there were men of stature on the hoards who had traditions to maintain. The simplicity of his acting and the ahsence of apparent effort were a lesson much needed to-day. He was modestly impersonal in his little speech at the end of the second act. Miss Mary Moore proved a revelation that made many rub their eyes and ask if they could he mistaken in recalling her as the demure comédienne of the old Criterion Theatre more than twenty years ago. As an actress she has matured in her art. It was a charming revelation. The other players were Sam Sothern as the hushand, and Miss Lillias Waldegrave as the governess, both of the London company. Mr. Sothern's performance is notahle for what he refrains from doing that could so easily he done with disastrous effect hy a more self-conscious or less experienced player. Miss Waldegrave is a tall, typical English girl, with a pleasant voice and a sincere method of portrayal.

The withdrawal of "The Narrow Path" from the hoards of the Hackett Theatre, in this city, is not in itself a matter of much importance. The piece was too dull and silly to he very mischievous, and must, in any case, have fallen into quick ohlivion. But the attitude of the owner of the house is especially welcome as an indication of returning managerial common sense. He demanded the removal of the play on the ground that it was a nuisance which would damage his property. This is a point on which the *Nation* has often insisted. When other theatre-owners and directors fully realize that temporary gains derived from concessions to the coarser appetites of the vulgar will not compensate for the permanent alienation of the great hody of decent supporters of the theatre, the purification of the stage will be effected promptly. In matters of this kind the pocket is likely to he more sensitive than the conscience. The argument advanced against "The Narrow Path" applies with equal validity to several other realistic pieces of the current season. These may he making money now, but they will not prove profitahle in the long run, as their promoters will discover when the reaction that inevitahly follows after an intellectual and moral debauch once sets in.

Eugène Lintilhac continues his history of the theatre in France hy a fourth volume on comedy in the eighteenth century (Flammarion). This author is a member of the French Senate.

Music.

MUSICIANS AND MANAGERS.

The death last week of Henry Wolfsohn removes from the musical community of New York one of its most interesting and influential figures. The founder, some twenty-five years ago, of the first musical bureau to be established in this city after the model of foreign agencies, he had become so powerful as fairly to dominate, in the eyes of many persons, the concert field, not only in New York, but in the country. To say that almost all programmes of first-class concerts bore his name or were made up through his agency, would be an exaggeration. But the list of "stars" whom he managed, at one time or another, contains the bulk of the names most familiar to the concert-going public. Hundreds of music-lovers who never saw him have drawn from his bureau the artists who entertained their guests. Fritz Kreisler, Schumann-Heink, Josef Hofmann, Mischa Elman, Louise Homer, and Corinne Rider-Kelsey are a few of those who have made money through and for Mr. Wolfsohn. And, if rumor is correct, he reaped a wonderfully rich reward for his industry and ability.

Not that Mr. Wolfsohn was popular with the artists who came to him. Many would have preferred to give him a wide berth, and hated to pay his commissions. These were often superimposed upon those claimed by the German or English agent who had originally lured the musician into his net, so that even a well-established artist might have to pay out 40 per cent. or more of his earnings before receiving anything himself. But as Mr. Wolfsohn's influence grew it became more and more necessary for young and struggling artists to turn to him. What position is there more trying than that of a young musician who arrives in New York without much Continental fame and without having been heralded by skilful advance agents? We have in mind one who had made for herself an excellent place in Berlin. Arriving here practically friendless, so far as persons having large influence were concerned, she turned at once to Wolfsohn. He demanded $5,000 to launch her properly. As this was far beyond what remained of the sum she had left over after her education, she took the next steamer back to Germany—a land not without its music bureaus, but far more friendly to budding genius.

Indeed, in Berlin, advance advertising of a new prodigy seems to hurt the performer about to make his début. The critics resent being told in advance about his artistic ability; they are there to judge for themselves. So the advertisements of first appearances are merely brief notices. Later on, there may be greater publicity, but even then Germans have not reached the stage of advertising musical talent, as one does soap, or patent oats, or the newest automobile. That, said one of Mr. Wolfsohn's rivals recently, is the way to make sure of success—"It all depends on how much money you want to spend in advertising." But these advertising charges sometimes cover a multitude of sins. There have been cases where the entire sum has been wasted, or even pocketed, by the agent. Another trick of the dishonest manager is to tell the artist—when properly reduced to despair by a fruitless search for engagements—that if he pays, let us say, $150, he may appear with some soloist of established repute. The victim sometimes discovers that the $150 never reached the brother-performer, but stuck to the agent's fingers. Again, if a society in Waukesha engages an oratorio singer through a bureau, it has no means of knowing whether the $400 check it sends for a well-known soprano reaches the performer intact, or whether the agent turns over only a half.

It is this sort of experience which has led one violinist of international renown to fix his price at $150 an appearance and to insist upon its being paid to him entire. Whether his manager makes $200 on the side by a higher charge to the orchestra, does not interest him. He feels that $150 is reward enough, and does not care if the manager, and, as occasionally happens, the music committee or leader of the saengerfest gets a rake-off as well. For orchestras, too, even the longest established, have frequently drawn their soloists from Wolfsobn—to the despair of young performers who would not or could not meet Wolfsohn's terms, and of others who had no European experience to interest managers in their careers.

What, then, is the remedy? Mr. Wolfsohn's bureau is sure to go on as did its famous pattern, the Wolf agency in Berlin, after the death of its founder; and there will always be struggling artists without the common-sense, or means, or ability, or reputation, to manage themselves. No better way of bringing artists and public together has been suggested. A change for the better can only come through the raising of the tone of all the agencies and the checking of the too-powerful by able competition. There is now an effective remedy for the artist-employing class: make sure that your check for the fee agreed on reaches the artist, even when you hear of him through an agency, and, wherever possible, deal directly with the musician himself.

A notable movement to encourage the production of new opera is just announced in Germany, whereby every three years two prizes of 10,000 marks each and two prizes of 2,500 marks each will be given for the best works by "Young Germans." The contestants will be allowed to offer almost any kind of a musical composition known as operatic, but each piece must be at least an hour long. All compositions offered will be passed upon by two successive committees of eminent musicians in Germany, among whom is Richard Strauss, and the two first operas to receive the chief prizes will be produced in the Hamburg Theatre, in November, 1910, and in January, 1911.

Art.

"FAIR WOMEN" IN PARIS.

LONDON, May 29.

It may be because ours is the Age of Woman, as Édouard Rod makes one of his people say, but certainly it is only necessary to fill a gallery with the portraits of women to draw the crowd. Artists complain of hard times, many exhibitions scarcely pay their way, but the International Society in London has found it worth its while to give a show of "Fair Women" two winters running, and this spring in Paris two exhibitions of the kind, following others in previous years, are open at the same moment, both well attended though the price of admission is double that usually asked elsewhere.

However, in France, where there is some sense of order and logic, it is not quite enough to get together any chance collection of portraits of women —some reason must be found for it. At the Exposition de Cent Portraits de Femmes in the Salle du Jeu de Paume in the Garden of the Tuileries, all the portraits are of the eighteenth century, fifty by French painters, and fifty by English, so that a comparison may be made. At Bagatelle in the Bois de Boulogne, the exhibition is of Portraits de Femmes Sous les Trois Républiques, and the result is that, in both cases, the collection has historic as well as artistic interest.

The exhibition in the Garden of the Tuileries is in every way the more interesting of the two. The period covered is, as a whole, finer, more care seems to have been taken in the selection of examples and in their arrangement, and the comparison between the French and English work is delightfully suggestive. It would be still more suggestive if the English pictures all reached the same level of excellence. I have heard it said that the recent exhibition of English pictures of the same date at Berlin, has discouraged some owners from parting with their treasures so soon again. But, however that may be, I have often seen a more splendid series at the Winter Exhibition of old masters in the Royal Academy, and even once in Paris in 1900. The principal British portrait-painters are all represented—Hogarth, Reynolds, Gainsborough, Romney, Hoppner, down to Lawrence and Raeburn. The portraits are frequently of people famous in their day—Peg Woffington, by Hogarth; Nelly O'Brien, Kitty Fisher, Maria Walpole (Countess Waldegrave), by Reynolds; royalty by Gainsborough; Lady Hamilton, by Romney; Countess Waldegrave again, by Hoppner. But the work is not always the artist's best, nor does the distinction or fame of the sitter always seem to have been a consideration.

There are five examples of Hogarth, with whom the series begins chronologically, but not one to rival the portrait of himself in the National Portrait Gallery, or the group of David Garrick and his wife at Windsor Castle, or the wonderful Shrimp Girl in the National Gallery; and only one that gives some idea of his insight into character and his power of rendering it. This is his Sarah Malcolm the murderess, a middle-aged woman, as he shows her, highly respectable in neat cap and quiet grays, with a face so placid in its hard cruelty that her crime seems all the more revolting. His Peg Woffington has less character, but a charm and a delicacy in the detail of lace and flower that are not usually associated with Hogarth, who, however, is so little known on the Continent that when he is represented there at all it should be at his strongest. It is the same with Reynolds. There is no painting by him that can rank with his masterpieces. But Reynolds is better known on the Continent than Hogarth, his six or seven portraits are more representative, and the subjects and methods alike would explain to those who had never seen his work before that he was the fashionable portrait painter of his day. They are representative, also, unfortunately, of his very defects, for in two or three, especially the Kitty Fisher, the color has faded until they are mere ghosts of their old rich beauty. Gainsborough was not apt to distinguish himself when he painted royalty, and two of his portraits here are of Queen Charlotte, less inspiring as sitter even than most royalties of her generation. Nor, with one exception, could his other portraits—seven in all—of themselves account for the greatness of his reputation. This exception, however, is a splendid Gainsborough—the half-length Anne, Duchess of Cumberland; the face full of charm and character, and the rose and white of the delicate bodice given with rare skill and subtlety, a piece of color that Nattier and Drouais could never have approached.

Romney, probably, was the most uncertain of painters, and nothing in the present collection would suggest that he could, at times, rise to the heights of his fine Mrs. Cawardine and Child. That he had a fancy for sentimental prettiness is seen well enough in the two familiar Lady Hamiltons, one as Euphrosyne, the other at prayer; in both, the sweetness is overdone, but in both at least a semblance of realism that makes them vigorous in comparison with the dull, wooden portrait of the same beauty, as Sybil, by Mme. Vigée-Lebrun.

Hoppner has recently enjoyed a success in the auction room that his work rarely justifies, certainly not as it is seen in the five portraits selected for Paris. The four by Lawrence fail no less to maintain his fame and popularity. The one British painter who triumphs, not only by his reputation at home, but by the work now shown, is Raeburn, though even at home he is only beginning to be honored as he should. He had his lapses; he, like the rest, painted an incredible number of portraits, and in some he is almost as feeble as Romney at his feeblest. But when Raeburn forgot the conventions of the day and painted people as he saw them, it is another matter; and not Reynolds, not Gainsborough, ever attained the mastery of character and technical skill of the Scotch painter who was "the pupil of Nature," as R. A. M. Stevenson described him, and who, as Louis Stevenson wrote, "looked people shrewdly between their eyes." As it happens, two of his finest portraits are here: his Mrs. James Campbell, the ugly, humorous, shrewd old woman, in the uncompromising cap and fichu and little shawl then in fashion, and his Mrs. Scott-Moncrieff, young and radiant in her beauty, with no need of a theatrical rôle, or a sentimental pose, to enhance it. The "most amazing" and "the loveliest" of his portraits these two have been pronounced, and in their truth and directness they stand out and seem to live in the midst of the portraits, both French and British, in which so often life disappears in the conventions of the time.

To pass from the room where all these pictures hang into the next, where the French collection is arranged, is to be struck with a contrast as vivid and complete as when one lands in Calais after crossing the channel from Dover. The French group is as representative: Boucher, Greuze, and Fragonard, Nattier, Largillière, Drouais, Mme. Vigée-Lebrun, and a few others of lesser note. The portraits often gain as much in interest from the women who sat for them. Here, the points of resemblance between the two collections come to an end. After the British portraits, the French seem at once more formal and more vivacious. The British painters

had their own conventions, inherited, through Kneller and Lely, from Van Dyck; many, with Reynolds, made no secret of their debt to the Italian masters; each brought some chance picturesqueness of his own. As a consequence there is in the British art of their day much the same variety, bordering on disorder, that you find in British architecture or almost all British design. The French carried out their conventions more strictly, more academically. Their painting is as correct in its classicism as their poetry, and it must be admitted that in this order there is, at times, a tendency to monotony, even frigidity. The sentiment of Greuze, in the Jeune Veuve or Jeune Fille en Vestale, for instance, has an almost classic dignity, so unerring is the knowledge that produced it, when compared to the sentiment, born of the emotion of the moment, in any one of Romney's Lady Hamiltons. The animation in the pose and gesture of Largillière's flamboyant ladies seems to belong less to the individuals than to the period, to be as much the outcome of the style in vogue as were the palaces and gardens and theatres where these ladies practised their arts. The flowers that Nattier's sitters hold and twine into garlands never soiled their slim hands in the picking, for they were of studio growth, to be used again and again, actually the same blossoms appearing and re-appearing, as the same hands appear and reappear in one portrait after another by Van Dyck. Drouais's ladies, in their grace and elaborate artlessness, are no less ruled by formula. Indeed, of all the fifty French portraits, only one has an air of realism, as if nature had been served, not dominated, by convention, and this is a very beautiful Jeune Fille Lisant by Fragonard: a half-length of a girl, seated, holding a book in her hands and leaning back against cushions, the face, pose, and color scheme full of character that belongs to the young girl herself, and not to an entire series.

And yet, all these pictures hung together are much more vivacious in effect than the British. They reflect the vivacity, the intellect, the wit, the elegance of the age in which they were painted, and are, therefore, so much truer to it than portraits where conventions are accepted but less rigidly enforced that they make the simplest work of the British painter seem artificial, and his most conscientious rendering of the sitter before him become dull and lifeless. No one portrait stands out with the force of Raeburn's Mrs. James Campbell and Mrs. Scott-Moncrieff, but the level of accomplishment is higher and more evenly maintained. In the French series the beauty is as much a matter of deliberate design as the architectural stateliness of Paris; in the British series, it is as much a matter of chance as the atmospheric picturesqueness of London.

A few drawings have been placed in a smaller room, and here, too, I found the same suggestive contrast.

At Bagatelle, the idea of the exhibition is more interesting than the exhibition itself. Certainly, I have come from it with nothing very definite added to my knowledge of, or interest in, the women of any one of the three Republics. This is not wholly because the expressiveness and elegance of the French convention weakened with the first inroads of Republicanism. Neither is it because women of as much note do not figure here as among the hundred portraits of the Salle du Jeu de Paume. But the trouble is that the portraits are not as representative and distinguished as they might be, and there are far too few to do justice to the First Republic. The Second and Third cover, between them, a vaster space of time, I know, but for this very reason not one portrait which is not specially typical of it should have been included. As it is, I can only suppose the collection was made in haste, so little attention has apparently been paid to this first essential.

However, the pictures at Bagatelle are a secondary consideration, an excuse for a visit to one of the most enchanting spots in the Bois, with its terraces and gardens all abloom in May, its wide vistas and shady walks, and the many associations that make it the place of all others for a show of the portraits of women.

N. N.

The advantage of a "one-man" show is that the artist can exhibit work done to please himself which, even if accepted, might be swamped in the large exhibitions of work done to attract the public. Certainly, it is in the quiet of M. Durand-Ruel's galleries, Rue Lafitte, Paris, that Monet's astonishing studies of water lilies can best be seen and enjoyed. There is no other painter to-day, probably, who would attempt such a series, and, if he did, could obtain such extraordinary results. As in Monet's paintings of Haystacks and of Rouen Cathedral, the object is to render the passing effects of light and atmosphere; but a new problem has been added, for Monet, in his later work, has watched and noted these effects in the reflections thrown by sun and cloud and foliage in the water of a little pool or stream. There are forty-eight paintings in the series, and they are fairly large. In almost all he shows merely the surface of the water with the lilies afloat upon it, so that it is only by the reflections you know whether the pool is wide or narrow, shaded or open to the sun; whether the sky is clear or clouded; whether it is midday, afternoon, or evening. Occasionally he gives also a portion of the wooded banks, but it is then scarcely more than a suggestion. The truth of these studies is not more remarkable than the beauty of the color he gets in many of them—lovely arrangements of pale blue and silver, of roses, or sometimes of more vivid golds and scarlets, of strong greens and grays. As in much of his later work, there is no design, no composition. Lilies float, clouds and trees are reflected, without any great rhythm of line. But it is needless to criticise him for not doing what he never set out to do. His object was to transfer certain of nature's most subtle effects to his canvas, and in this he has succeeded triumphantly, for, within his limits, Monet has no rival.

A new museum, the "Storico-Topografico," illustrating the changes which the appearance of Florence has undergone during the centuries, has been opened in the House of Michael Angelo. It fills eleven rooms hitherto closed to the public. The earliest known view of the city is reproduced from a fresco in the Bigallo, dating from the middle of the fourteenth century. Another very early panorama shows the ancient façade of the Pitti palace without the wings, attributed by Brockhaus to the *bottega* of Francesco Rosselli, now preserved in Berlin, while another is from Schedel's "Cronica," published in Nuremberg in 1493. A series of water-colors of the ancient gates and walls by Antonio Bargioni has been permanently lent by the Laurentian library. There is also a view of the chapter houses in the piazza of the Duomo, in which the famous sarcophagi of Guido Cavalcanti, now in the court of the Riccardi palace, are represented in their original places. But the scope and varied interest of this collection are better indicated by its classification. Different rooms are devoted to plans, maps, and panoramas; walls and gates; the Arno and its bridges; piazzas and loggias; public buildings, palaces, towers, and streets; the Mercato Vecchio; churches and shrines; festivals and ceremonies; suburbs and gardens. Nor is the collection lacking in artistic interest. There are, for instance, such characteristic original designs as the interior of Santo Spirito, by Gerolamo Genga, before the baldacchino was erected in the choir. Joseph Pennell's hand appears in two pen-and-ink drawings, and one charcoal. Corrado Ricci, to whom the museum owes its inception, justly claims that the collection is necessary for understanding the history of the city, helpful in the restoration of buildings altered during the centuries, and of interest to every author or artist who wishes to recall the past. The excellent descriptive catalogue containing over 1,300 entries, an index of subjects, and one of artists, is in itself a work of value.

Prof. Flinders Petrie, in a lecture at University College, London, May 20, gave an interesting account of his work at Memphis and Thebes during the past season. The chief discovery at Memphis was the palace of King Apries—the Pharaoh Hophra of the Bible—who was contemporary with Jeremiah. This palace was of impressive scale, about 400 feet long and half as wide. The middle court was over 100 feet square, with painted stone columns over forty feet high. A still larger court extended on the north side, in which lie capitals of columns which must have been about fifty feet high. The approach to the palace led up through a large mass of buildings, to a platform at a height of about sixty feet above the plain. The roofing of the halls was by cedar beams. Pieces of these were found, one of them with an inscription carved on it.

Among the ruins were also discovered a large number of scales and plates of iron and bronze, which originally belonged to scale armor. The scales are sometimes quite thin, under half an inch long, sometimes stout ribbed plates two inches long. Some good bronze figures of gods and sacred animals were also unearthed. But what gives an idea of the magnificence of the palace is a fitting of a palanquin, of solid silver, a pound in weight, decorated with a bust of the goddess Hathor. The workmanship is of great beauty, though it served merely as an attachment for a strap to a wooden beam. It was found buried in a hole in the floor of a hall used for a workshop. As this is a unique specimen it will remain in the Cairo Museum. In several places traces of still older buildings than the Apries palace were brought to light, such as the ruins of a large gateway of the Twelfth Dynasty. This was twenty feet high, and the greater part of six scenes which decorated it can still be put together. The sculpture is in low relief of much delicacy. The temple of King Proteus, Merenptah, which was discovered last year, has been partly cleared. It appears that, according to his usual habit, the King took his building materials from older works. Thus the capitals of columns found here are apparently of the Fifth Dynasty, like those seen in reliefs of that period.

Before Memphis was dry enough to work, two months were spent at Thebes, where the ruins on top of the mountain were explored. They were found to be a chapel for the apotheosis of King Sankh-ka-ra, of the Eleventh Dynasty; it contained the pieces of the cenotaph and the Osiris statue of the King. Two of the desert valleys were exhaustively searched for concealed burials, and one untouched group was found. The coffin was covered only by about a foot of earth and stones. Around it were offerings of furniture, food, vases, and personal ornaments. On the mummy were a gold collar of four rows of rings, four gold bangles, earrings, and a girdle of electrum. This is one of the most complete burials known. Other interesting discoveries at Thebes were the clearing of a new temple site, two fine stone figures, and an untouched burial of the Twenty-fifth Dynasty.

The Pope has appointed Prof. Luigi Canevaghi, in place of the late Ludovico Seitz, director of the new Pinacoteca, and curator of the other paintings of the pontifical palaces. Professor Canevaghi's work at Milan, especially his restoration of Leonardo da Vinci's Last Supper, has been highly praised by competent judges, and his appointment to this responsible position is favorably received.

The fund for establishing an Italian School of Archæology at Athens, started a year ago by a few scholars in Florence, is now considered sufficient to permit opening next autumn. A villa has been rented. It is expected that the field work of the school will be limited for the present to supplementing the Italian excavations of the last two or three seasons in Crete.

The prizes of the Salon des Artistes Français have been announced: The Prix Lefebvre-Glaize (900 frs.) fell to Clovis Cazes; the Prix Rosa Bonheur (1,500 frs.) to Charles Fouqueray. No first medal was awarded in painting. In sculpture the five first medals were taken by Louis Couvers, A. Terroir, G. Verez, Roger-Bloche, and P. Roussel. In architecture the first medal went to Tony Garnier.

François Émile Michel has died at the age of eighty. He began his studies under Migette, an instructor of his native town, Metz, and afterwards worked at Paris, obtaining medals at the Salons of 1868, 1889, and 1900. Two of his pictures are in the Luxembourg. He also wrote much on art topics, including books on Rubens and Rembrandt and "Études sur l'histoire de l'art."

From Munich is reported the death at the age of forty of Ferdinand von Recnicek, best known for his satirical drawings in *Simplicissimus*.

Finance.

THE RISE IN STEEL STOCK.

A speculation for the rise, unusually violent and accompanied by transactions of uncommon magnitude, sprang up on the Stock Exchange two weeks or so ago. On two days of last week, the dealings were 1,400,000 and 1,600,000 shares, respectively, whereas a "million-share market" had been a rarity during many months. The higher of these two totals, that of last Friday, represented the largest daily record reached since November 13 last year—the culminating day of the "after-election bull market," at the time when speculators, great and small, were rushing into the market to participate in the "boom" which they had come to believe must inevitably follow Mr. Taft's election.

They had some serious disappointments before them; prices broke again at the close of the year, industrial unsettlement returned, a war of price-cutting broke out in the steel trade. Then came the upward turn, reaching at least its temporary climax last week. On this occasion it was not, as in last November's outlook, the speculating public which ran riot in the market. Wall Street had no illusions on the subject in the present case; the Stock Exchange commotion was the outcome of aggressive operations by a group of powerful millionaires. But their speculative plans were facilitated by the fact that the share-holding public apparently would not sell, and, within a little more than a week, such advance in prices had been scored as 6 points in Union Pacific stock, 7 in Chicago, Milwaukee and St. Paul, 6 in Amalgamated Copper and New York Central, 12 in Southern Pacific—most of them running close to, or exceeding, the top prices of 1906.

Early in the movement, however, the speculative lead was taken by the common stock of the United States Steel Corporation. On Thursday of last week, this stock sold at 69⅜. A week before it had closed at 61¼; two weeks before, at 58⅞; a month before, at 56⅛. Until last Friday, it had reached a "new high record price" for its whole history on each successive business day since May 18. Its highest record, prior to that date, was the 58¾ touched on November 13, last year, the culminating day of the "after-election boom." Its highest price in the immensely prosperous steel trade year 1906 was 50¼; its highest in another year of great earnings, 1905, was 43¼; its top notch in the memorable speculation of April, 1901, was 55, and that was high record until last November. In 1901, the stock was paying twice as much in dividends as it pays to-day; in 1906, it reported net earnings 40 per cent. larger than what its statement for the first quarter of 1909 indicated. At present prices and the present dividend rate, the stock yields 2⅞ per cent. to the investor.

This is not all of the checkered history of the stock. After the price had risen to 55 in the famous three-million-share day of the April market of 1901, it dropped to 24 on the equally famous 9th of May. The public again resumed its buying. There followed the extraordinary plan of 1902 to turn $200,000,000 of the preferred stock into mortgage bonds, the litigation and injunctions, the 20-point break in the price of the new bonds "when issued," the abandonment of the conversion plan at the demand of large inside interests, the collapse of the company's earnings, the suspension of common stock dividends, and the fall of "Steel common's" price to 8⅜ in May, 1904. This series of events was such as might quite conceivably have shattered the faith of an outside investing public. Yet we have the longer sequel before us.

How is this season's extraordinary rise to be accounted for? There are four prevalent explanations which have been current on Wall Street, and which may be repeated as Wall Street habitually sets them forth. First, the steel trade is bound forthwith to reach a status of activity and profits never approached in history. Secondly, the stock has been indirectly listed on the Paris Bourse, and the rich French public will pay even higher than present prices, if it can get the shares. Thirdly, the American public and the American speculators have gone crazy over an idea and an illusion, and have lost all sense of values. Or, fourthly, the company's policy of the past five years will be reversed; it will be bonded for such expenditures as have hitherto been paid from earnings, and the surplus will be thrown into dividends, at some high rate, for the common stock.

Such basis as the first argument may have, would apply equally to most other stocks on the Wall Street list; it does

BUR INDIANA PUBLIC LIB.

not, taken by itself, explain the rise in "Steel." Furthermore, the remarkable fact must be taken into account that the products of the company are still selling 25 per cent. below last year's prices, and that the business of the corporation is barely three-fourths of its showing in the active pre-panic period. The "listing" on the Paris Bourse was an unusual achievement; the Steel shares were refused admission in 1901, and no one seems quite to understand what the assent on the present occasion means. It may mean that the French investor is determined to speculate in the stock, or that the Paris banks which handle his savings have resolved to make him do so. The French investor is a good deal of a mystery; yet he is rather noted for desiring a sure thing, with whose conditions and surroundings he is acquainted, and he does not know America. The American public's imaginative impulses can be appealed to with effect; it is not certain just how much of a part its beliefs or credulity may have played.

As to reversal of the policy of fiscal conservatism fixed on the property since its perilous experiences of 1903, that must be left to conjecture, however perplexed or reluctant it may be. Strange events certainly marked the first three years of the Steel Corporation's history, and the era of strange events may not have been ended in Wall Street, especially when some change is suspected to have occurred in the dominant influence in the company's finances, since the panic of 1907 and perhaps as a result of it. The statement of this array of possible factors in the case gives keen edge to interest in the part which the stock of this company, after all its vicissitudes of the past eight years, may yet be made to play as a pawn in the hands of the great speculators.

BOOKS OF THE WEEK.

Annual Report of the Superintendent of Banks for the Year 1908. Albany, N. Y.: J. B. Lyon Co., State Printers.

Armstrong, Edward C. Syntax of the French Verb. Henry Holt.

Ayres, Leonard P. Laggards in Our Schools. New York: Charities Publication Committee.

Baedeker, Karl. Northern France. Scribners.

Ready This Week

Johnston's The French Revolution, A Short History

By R. M. JOHNSTON, Assistant Professor of History in Harvard University. 227 pp. and index. $1.25 net.

A brilliant and readable treatment of the main outlines of the Revolution. The narrative merges into that of the author's "Napoleon." (See below.)

Johnston's Napoleon, A Short Biography

The publishers have added to their list this work which the *Nation* said was "scholarly, readable, and acute," and of which the *Boston Transcript* said: "It is difficult to speak with moderation of a work so pleasant to read, so lucid, so skilful." $1.25 net.

Just Issued

Witkowski's German Drama of the XIX Century

Translated by Prof. L. B. HORNING. $1.00.

This brief but brilliant monograph after a great success on the continent is published simultaneously in America and England. It considers Kleist, Grillparzer, Hebbel, Ludwig, Wildenbruch, Sudermann, Hauptmann, and minor dramatists.

J. A. Picton's Man and the Bible

A review of the place of the Bible in human history, which, while never lacking in reverence, seeks to show that the phenomena of the Bible and its relations to mankind are perfectly consistent with what is known of the process of human evolution. $2 net.

NEW YORK, THURSDAY, JUNE 17, 1909.

The Week.

We may well believe that President Taft has directed his Attorney General to make a thorough investigation of the Sugar Trust, with a view to criminal prosecution. The failure of the previous Administration to act in the premises had a bad look at the time, and appears even more a case of dereliction in the light of the event. The explanations which the former Attorney-General gave to the press, are themselves in need of explanation. Mr. Bonaparte declares that only "statements" were laid before him by Mr. Earle, not "evidence." But does he expect a complainant to prepare the whole case? What is the Department of Justice for, why are there Federal district attorneys and grand juries and a secret service, if not to run down the evidence of crime and bring the guilty to trial? That sort of work was done with great pains against the Standard Oil Company and timber thieves and the Beef Trust. Why was immunity given to the Sugar Trust? Perhaps, because it was in the category of the politically "good."

With brass buttons and epaulets becoming more plenty, with constant talk of fighting and inventions of new weapons, this country must watch to prevent its people drifting into dreams of empire that can only lead to disaster. Many wars are simply caused by the political ambitions of men and the love of military action, and we must be careful not to use our great and growing prosperity as an excuse for building new navies and increasing standing armies beyond the point where they are still a mere guard. . . .

These timely and excellent words of warning Justice David J. Brewer spoke last Saturday at Atlantic City, before the New Jersey Bar Association. His address was a plea for united action among the nations to put an end to war. He dwelt strongly upon the fact that "America is the logical nation to bring about universal peace throughout the world." There is no other so wonderfully situated to take the leadership. We wish that this highly honored Supreme Court Justice could influence Mr. Taft to take this overshadowing question under consideration. The Peace Congress in Chicago, the Arbitration Conference at Lake Mohonk, the local Peace Society, are but a few of the public bodies which have recently besought Mr. Taft to take the leadership in promoting international concord. Never was there a better time than the present; never was it more desirable to stop the growing drift to militarism in this country, and never was a greater opportunity offered to any statesman to achieve immortality than that which beckons across the oceans to William H. Taft.

The Massachusetts Legislature has passed an interesting old-age pension bill affecting the Boston and Maine Railroad, at the request of both the company and its employees. So enlightened an action on the part of a great corporation deserves widespread recognition. The proposed pensions are to be supplied by equal contributions from employer and employees, the former to make up any deficiency if the joint payment falls short of $200, the minimum sum. The company has promised to make an additional contribution to meet the needs of those already advanced in years, and provision is made by which regular pensions may be eked out with annuities voluntarily purchased by employees. The pension system itself is to be managed by a board of trustees in which the railway and its employees are equally represented, and it cannot be put into operation until adopted by a vote of two-thirds of the employees. Once established, the scheme creates legal rights binding practically all of the 27,000 employees as well as the railway, while the State aids by supervising the system and exempting from all taxation the funds which are to be guarded by both the insurance commissioner and the State actuary. The great advantage of this whole scheme is that it secures obligatory contributions both from the railway and the employees by democratic methods; and it becomes of especial importance in view of the belief that it may be extended to include accident insurance and sick benefits. Indeed, there are some who think that it may be followed before long by a general law under which other public service and private corporations may put into operation a coöperative old-age pension system.

We are all firm advocates of economy, and look with horror upon governmental extravagance, yet if a single appropriation or salary in which we or any of our friends have a personal interest is reduced by one penny, we cry to heaven about penuriousness and injustice. Witness the present experience of Collector Loeb in New York. After consultation with the authorities at Washington, he has been reclassifying custom-house employees, and cutting down the salaries of many of them. But is this hailed as wise and economical administration? Well, hardly. The rush of protesting politicians and party leaders to the Collector's office is something terrific. He has lowered the pay of my man! At once the party appears endangered, grave doubts are entertained about the municipal election, and it looks as though there would be a Democratic House a year from now, with President Taft rebuked and embarrassed. All because Inspector John Smith has been made a weigher, and had his salary cut $10 a week. Such are the pains of political economizing—the truly dismal science. We may be sure that there will be the same political wailing over the proposed abolition of a useless bureau in the Interior Department, at a saving of $100,000, and the new system of paying employees in navy yards, by which there will be an economy of $125,000. All such reforms mean officers out of a job, and officers out of a job mean the ruin of the party. Everybody hurrahs for economy, but who touches a hair of yon gray salary, dies like a dog.

Judge George Gray's manly independence was never displayed to better advantage than when he spoke out at Scranton last week on the "cowardly and un-American" boycott by the labor union. He was sitting as arbitrator between the traction company and its employees, and was told that certain merchants dared not put their names to a statement about prices, lest they should be boycotted. This roused the judge's indignation. He said that if the facts were so, they ought to be proclaimed to

the country to the discredit of the labor unions. As for himself, he declared that he would die in his tracks before he would submit to a boycotting labor union. This is the kind of sturdy utterance which once passed as thoroughly American and patriotic. If it has seemed to be going out of fashion, this is probably because many find it so much easier to yell for the flag, and a big navy, and to talk about licking all creation, than to show any fight when labor leaders or corrupt politicians threaten to injure their private business.

While the New York Presbytery held its theological examination behind closed doors, there seems to be little doubt that the young men whom it voted to license to preach, though it had refused to do so on a former occasion, hold views much at variance with current Presbyterian orthodoxy. It appears to be certain, for example, that they do not accept the historical doctrine of the fall of man, or of the virgin-birth. We shall soon know, for it is inconceivable that these things can be left hidden in a corner. The Presbytery will have to make a report of its procedure to the higher judicatories of the church; if it does not, it will be called to book by either the Synod or the General Assembly. That was the course taken to bring Professor Briggs to trial. He had no difficulty with his own Presbytery in New York. It was the church at large which finally lost patience with the tolerance accorded his opinions, and insisted on settling the question whether they could lawfully be held within the Presbyterian Church. It was settled, for the time, by the withdrawal of Professor Briggs.

But his heresies, if such they were, could not be compared in gravity with those now imputed to these young men. They apparently stand ready to throw over a good part of the dogma based on the supernatural. This is their individual right; and, of course, one way in which the churches grow more liberal, and toleration for new views is gained, is by having ministers, or candidates for the ministry, frankly state their convictions and ask if there is room for them in the church. But the process must be open. The Presbytery may have been wise to sit in secret, but it must know that all the facts are bound to come out. The New York Presbytery has long been suspected of being theologically lax. The Western Presbyterians have been accustomed to account for this on the theory of the deceitfulness of riches. Clergymen who are wealthy, or who have rich wives, or who are in contact with luxurious parishioners, cannot be expected to be severely orthodox. All the more reason, then, why the country hammerers of heretics will demand from the New York Presbytery the reasons for its latest toleration of error.

The well-earned honors paid to Wilbur and Orville Wright in the White House by President Taft are in refreshing contrast to the lack of governmental interest in their work at its inception. It is true, that the President acted for the Aero Club in making the presentations, and not directly for the government. But it is not too much to hope that such a ceremony may lead to more frequent official recognition of men who confer honor upon their country by discoveries in the realm of science. We are of those benighted persons who believe that achievements of this kind are more to the renown of this Republic than the possession of a hundred battleships, or than a dozen world-cruises of our latest sea-monsters. This is not because the aeroplane or the dirigible balloon is thought to be a new and more formidable engine of war. If that were its only usefulness, the sole reason for its existence, we should take very little interest in it. Neither Germany nor the United States nor any other country can hope for a monopoly of aerial Dreadnoughts. As soon as a step forward is taken in one land, it will be followed in another. England's naval position, her statesmen say, is worse for the invention of the sea-Dreadnought than it was before. It is as impossible to hide or to patent new ideas in naval construction, as it is in airships. The inventor Hubert Latham, who is now experimenting with a monoplane in Paris, may have taken some of his ideas from the Wright experiments; he may devise something vastly superior to their aeroplane, for which, it is said, they have already booked no less than 200 orders. The real reason, then, for the White House ceremony is not that the Wrights have furnished us with a new weapon, but that they have won for the United States in a field of science an honor as great, or nearly as great, as that earned for Germany by Zeppelin with the dirigible balloon.

The case against the comic supplement was forcibly restated last week by Mr. Percival Chubb, before the Public School Kindergarten Association. The luridly tinted Sunday "kid" is without question one of the most potent factors for vulgarity in our national life. Just how the process of vulgarization runs was suggested by the speaker when he complained of "always the same violences of color, form, and interpretation." It is not alone in its violence, but in the eternal sameness of subject and treatment that the pernicious influence of the comic supplement lies. Conceive, for instance, the state of a mind that will go on year after year drawing delight from the adventures of Happy Hooligan or the Katzenjammer Kids. Change, growth, are the necessary conditions of life. The child's mind, especially, must expand or die. But here are children's minds clamped down to a dreadful monotony. The contents of the picture have long ceased to attract. It is the mere familiar aspect of the horrible reds and blues that stirs a kind of galvanized laughter. An essentially quick-minded and humorous people, we are bludgeoned into accepting the stupid and the stale, as humorous. The cheap vaudeville performer has only to rip out, "I love my wife, but, oh, you kid," and his audience dissolves in laughter. It's the old grouse in the gunroom raised to the *n*th power of vulgarity.

Almost a decade ago, Dr. Edward Everett Hale wrote his "Memories of a Hundred Years," and if his death last Thursday still found him considerably short of the centenarian's score, yet he was indeed to most of us a link with what begins to seem a remote past. He belonged to the epigones, so to speak, to the generation that succeeded the great New England writers, standing between them and the men of to-day. His reputation, no doubt, has suffered somewhat from this intermediary character. Compared with the work of Hawthorne and Poe, his stories lack individuality, and the classical mark of writing that comes from an age complete in itself and set apart by distinct ideals. At the same time they miss the

emphasis and the intimacy that make the appeal of our newest fiction. Yet if he lacks the modern tone, it must not be forgotten that he did as much as any other American writer to mould the short story to its present form, taking it out of the poetical field in which Hawthorne and Poe worked, and giving to it some of its commonest ideas. His "Man Without a Country," coming at the beginning of the civil war, was a strong incentive to patriotism; it has been, too, the source of much later-day jingoism. In another direction his "Ten Times One Is Ten" has given an impulse to a vast deal of humanitarian fiction of a sentimental sort. Probably these stories are only a name to most of those who are reading the magazines of to-day, and the writer himself had begun to be a name. His death is a sign to tell us how rapidly our heroic age is slipping into the past.

In withdrawing aid from George Washington University, the Carnegie Foundation helps along the panic through which, as Clarence F. Birdseye has said, the American college must pass for its regeneration. To lose a gift already in hand is a terrible misfortune. Academic benefactions have always been clinched by all the methods known to high finance, mortmain, and diplomacy. The most highly approved have been used by the George Washington University in its efforts to secure pensions for its professors. Paper prosperity and paper scholarship it could show in abundance. Its productive endowment was $219,832.96, if you would only reckon it in the desired manner. And it had over 1,000 "regular" students, provided you acquiesced in the college bookkeeper's standard of "regularity." But now it is going to lose its pensions, because $219,832.96 looks like $123,500, from a Fifth Avenue office; and because the only real entrance requirement seems to be the candidate's ability to pay an entrance fee. It is not the money loss that hurts; the professors will bear this, anyhow. No, it is the publicity. Not all its pensions will leave so deep an impress as the Carnegie Foundation's airing of the ways of college administrators. The Washington institution will not suffer alone. Dozens of other pretentious minor establishments are probably playing fast and loose with their books.

Mr. Balfour said nothing new when he declared the other day that the fate of the British Empire would have to be fought out in European waters, if it depended on one naval battle. On that supposition the British fleet was reorganized five years ago, and on that supposition the war-mongers have been busy ever since. But Mr. Balfour's formal statement of opinion suggests one reflection: how poor a prophet Rudyard Kipling has turned out to be. It is not Great Britain's far-flung battle line that needs divine protection now, but a battle-line concentrated within the close confines of the North Sea. In response to no far calls will Britain's navy melt away; for Australia or Canada or South Africa may in case of war shift for themselves, and not much harm done, but watch must be kept over Heligoland. Year after year the uncrowned poet of British imperialism went on chanting the adventures of Tommy Atkins among the lower breeds, as if between these two the fate of empire was finally to be decided. But India now is not England's greatest fear, and the Bear with whom Kipling counselled England to make no truce, is become part of England's hope. England and Germany facing each other across the North Sea feel very acutely that the white man's burden is still—himself.

The finance bill, which passed its second reading in the House of Commons last Thursday, is the technical measure for putting the budget into legal form. The long fight will come, of course, on the third reading. It will probably not be over before September, possibly later. But the new taxes are already being levied. This is one of the peculiarities—we may say, excellencies—of the English financial system. As soon as the budget has passed the report stage, it becomes operative. Only so can the Chancellor of the Exchequer balance his books. Of course, if the finance bill embodying his taxes were later to fail of passing Parliament, the taxes actually collected would have to be repaid. But consider what chaos would follow if the House of Lords were, say next November, to throw out the finance bill. The new taxes would have been paid for nearly nine months, and, supposing that they could be in all cases returned, neither the existing government, nor any that might be formed, could pay its way through the fiscal year. Herein lies a convincing reason for believing that the Lords will not attempt to reject the finance bill. If they would like to do it on political grounds, they would be deterred by cogent financial considerations. It is interesting to note that the official action of the Conservative party was confined to moving that the finance bill be "read a second time upon this day six months." This is the ordinary form of a motion to reject. But both in 1907 and 1908 a Conservative amendment was offered to the finance bill to "broaden the basis of taxation"—that is, to introduce protective taxes. It is at least significant that, this year, with a general election almost certain to come next, Mr. Balfour has not cared to invite a discussion of taxes on food.

The question of Crete which now turns up to plague Europe and the Young Turks, is all the more complicated because both claimants to King Minos's ancient island, Greece and Turkey, can cite legal and moral justification. After nearly three-quarters of a century of almost continuous revolution, Crete received autonomous government in 1898, under a High Commissioner who is now designated by the King of Greece, and under the protection of Great Britain, France, Italy, and Russia. It was understood that the island was held in trust for Greece, and that annexation would take place as soon as order had been reëstablished and the internal administration was reorganized. With the new Constitution of February, 1907, the work of reconstruction was completed, and in May, 1908. the Powers announced their intention to withdraw from the island. Evacuation was to be completed by the last day of July, 1909. Still, Crete was impatient; on October 7 last the Chamber voted for annexation to Greece, but, acting on the protest of the Turkish government, the protecting Powers promised to take up the question of Cretan independence with the Porte, if peace was maintained on the island. If the Powers had carried out their intention of evacuating Crete, a dangerous situation between Turkey and Greece would have immediately resulted. Recognition of this fact has induced the protecting nations to announce a prolongation of their stewardship.

INTER-PARTY ALLIANCES.

Senator Aldrich loses no occasion to taunt the Western Republican Senators who will not follow his lead, upon the fact that they are acting with Democrats. They use tariff arguments such as have been common in Democratic mouths; they vote on the Senate roll-calls with Democrats; they are just now entering into a hard-and-fast agreement with the Democratic minority to stand together on the income-tax. How could the proof of party treason be stronger? Was there ever an alliance which so well deserved the name of "unholy"? Of course, Aldrich does not refer to the fact that certain Democrats are found voting with him. The alliance works two ways; but we presume that the Rhode Islaud Senator would be able to make out a sharp difference. When Democrats forsake their party principles in order to side with the Republican leader, it is only a tribute to his skill and noble patriotism. When Republicans, however, repudiate the beneficent dictation of an Aldrich, they declare themselves at once traitors to their party and enemies of the republic.

The confusion of ideas on this whole subject rises partly from the fact that certain forms of combination between parties are unquestionably abhorrent and harmful. When men strike hands across the party fence to do the behest of politicians, to compass a union for plunder, to band together for the thwarting of good legislation, the grounds for suspicion and for denunciation are good. It was an inter-party alliance of this kind that opposed and harried Gov. Hughes at every step, last winter. Raines and Grady could not have been deeper in each other's confidence, or have played more deftly into each other's hands, if they had been party brothers instead of sworn enemies. But they became friends—just as Herod and Pilate did—out of a common enmity to the good. Such Tammany-Republican agreements have not a word to be said for them. They are based upon no conviction except that the spoils ought to be got for the worst men. In that respect, they are not unlike that other joining of forces between two parties which we have lately seen in Illinois. The Republican majority in the Legislature had long been deadlocked on the question of electing a United States Senator. Finally, enough Democrats abandoned their principles to vote for a high-tariff Republican Senator, who was besides a politician of low type, and the trick was done. No one can defend such inter-party junctious. They have bad faith and midnight bargaining stamped upon them. Yet the odium which properly rests upon such transactions ought not to be visited, as Aldrich would visit it, upon the kind of party cleavage now visible at Washington.

In the first place, no one can accuse those Republican Senators who have broken with the party orgauization in the Senate, of selfish or unworthy motives. They have nothing to gain except the approval of their constituents and their own consciences. All the sordid temptations are, for these Senators, in the other pan of the scales. They could have made their own terms with Aldrich and Hale. Anything in the way of recognition and promotion, or the right to legislate for their own pockets, they could doubtless have had if they had agreed meekly to follow the directions of the Finance Committee. But they have preferred to make their protest against a blind and ruthless leadership. The fact that this causes them to vote often with Democratic Senators is no indication whatever of an "unholy" alliance. The Democrats are, in this case, both standing by their party professions and doing the legitimate work of the Opposition. With them the dissident Republicans align themselves temporarily, because in no other way can they so emphatically express their sense of outrage at the foolish and obstinate leadership of their own party in the Senate.

Now, such an exhibition as that does not at all call for the hurling of Aldrich's epithets. The provocation ought, rather, to be considered, and the thing aimed at taken duly into the account. What we are seeing is only the historic process by which, under our system of party government, the majority is opposed and checked when it is rushing into wild extremes. Members of the majority, with clearer insight or cleaner conscience than the party leaders of the moment, break way. What happens then? Why, the bad leadership is discredited, as Aldrich's is before the country to-day. The Republican *Tribune* of New York reminds him that "the verdict of an almost united Republican press is against him." In such a plight, there is nothing to do but to make desperate bargains with a corrupt minority, or to prepare to capitulate. There are signs that Aldrich has done both. He has paid a few Democratic Senators their tariff price. Yet so long as the greater part of the minority cleave to their integrity, the tacit alliance between them and the rebelling Republicans is one purely on the basis of principle, and for the public interest. It is not an understanding, or working agreement, based upon the weakness or the treachery of the minority, as was the Grady-Raines combination at Albany. What we have is simply honorable men standing up, at great personal cost, for their convictions. That being so, this inter-party alliance will command respect, and is bound to have important political consequences, even though the heathen in the Senate rage and imagine vain things. The time may yet come when these Republican Senators who withstaud the madness of party leadership, will be held in as high honor, and will be judged to have done as great a public service, as those other Republican Senators who broke with their party to prevent the impeachment of President Johnson.

A TRUST HALTERED.

If any thing could further injure the standing of the Sugar Trust, after the revelation of its despicable thievery from the government by falsification of weights, it would be its confession last week in the matter of the Pennsylvania Sugar Refining Company's suit for damages. That concern had asked for thirty millions of dollars for injury done to it in plain contravention of the Sherman Anti-Trust law; it had already begun an action in New Jersey which was to be argued on appeal this week. The Trust contended that a case had not been made out for submission to a jury; that no damages had been proved, and that the adverse decision in New Jersey was a bar to this suit. These contentions found no favor with the judge, and the Trust then decided to settle. The final terms have not yet been announced, but are stated to be $2,000,000, besides the cancelling of the loan and the returning of the securities. There can be no question that in this case settlement is confession of guilt, as Webster argued of suicide.

The closing of the Pennsylvania

Sugar Refinery by the Trust is as interesting a story of corporation trickery as has seen the light of day. Built in 1903 by Adolph Segal, the Philadelphia real-estate operator, it was at the time of its completion a model refinery, modern in every respect, and superior to any plant possessed by the Trust. Segal had erected it for the express purpose of competing with the Trust, and that he was in position to do so successfully appears from the great interest taken by the Havemeyer concern in the new rival. Segal himself is a remarkable character. Coming to this land twenty-five years ago an almost penniless immigrant, he quickly amassed a fortune, and aided materially the development of Philadelphia by his successful real estate speculations. In the course of time, however, Segal became too much involved, and came to grief financially with the sensational failure in 1906 of the Real Estate Trust Company of Philadelphia, now a party to the suit against the Sugar Trust. The president of the Trust Company committed suicide, and Segal, with two officers of the company, was indicted on forty-one counts for fraud and conspiracy. Not until two years later was Segal able to obtain justice and prove that he was guiltless of any wrongdoing. The receiver of the Trust Company, George H. Earle, jr., now its president, aided him to obtain this exoneration.

At the time when he first found himself in financial straits and needed a loan of $1,250,000 on his new refinery, he received an offer of accommodation from Gustav E. Kissel. Segal, not being aware that Kissel was an agent of the Sugar Trust, accepted the offer, to which was attached the condition that, during the pendency of the loan, the holder of the seven millions of collateral—mostly securities of the new refinery—should name the directors. He had tied up $2,600,000 of stock out of $5,000,000 in a voting trust, and he was in great need of the additional money. Mr. Kissel and three clerks of the Trust were elected directors, only to show at once the meaning of the whole trick. Instead of representing unaffiliated capital, Mr. Kissel was there to do the bidding of the Trust. Its orders were to shut down the plant, and its four dummy directors did its bidding; from that day to this no labor has been employed in the Segal refinery. Its magnificent machinery has lain idle; its buildings have stood silent and empty. But the Trust had been successful in its aim. At a cost of only $1,250,000 it ended all fear of trouble in that quarter, and the failure of the Real Estate Trust Company, with the consequent injury to Segal's reputation and the ensuing legal complications, helped to continue this satisfactory state of affairs.

But there are still courts in the United States, as the Trust has now learned. The much-discussed Sherman Anti-Trust law again proved its value, for it made possible a successful action, and properly defined the base scheme which trapped Segal as an illegal combination in restraint of trade. The outcome thus becomes of national importance; a most powerful concern built up and fortified by grace of the Republican party and its protective tariff—it was Mr. H. O. Havemeyer himself who dubbed the tariff "the mother of Trusts"—is yet amenable to the laws, by a procedure regularly brought without the aid or interference of the government. Not even the ablest legal talent to be obtained could avert the collapse in court, or prevent the Trust's paying heavy damages—its stockholders have had the pleasure of seeing four millions of dollars, or, if the Segal loan is also cancelled, $5,250,000, paid out of the treasury within two or three months to cover the wrongdoing of its officers, high and low.

We have dwelt upon this case because it is typical of the kind of business immorality which made the public accept Lawson's combinations of fact and fiction as unvarnished truths, gave rise to the recent bitter outburst against large corporations, and created for Mr. Roosevelt the opportunity, of which he so readily and skilfully took advantage, to make himself the champion of the people against corporation dishonesty. We confess to being extremely tired of hearing corporation managers blame politicians for the hard times they have been going through. The responsibility is theirs, and theirs alone. So long as the history of the Standard Oil exists, so long as this story of the Sugar Trust remains a written record, the public will believe that the crusaders of the last few years had the right on their side, however crude and mistaken their methods. But we feel almost like apologizing to the Standard Oil for connecting it with the Sugar Trust in any way. Can any other concern have sunk to quite such depths of baseness? It cheated, like the lowest greengrocer, with fraudulent scales; it knocked out a competitor by a low trick. It merits and will receive the contempt of the country.

ROBBING BY LAW.

Gratifying indignation has been displayed by even the high-tariff press at a tricky and thieving Sugar Trust. Cheating the Treasury by false weights, and so, in effect, filching money from every citizen, has been virtuously denounced. But while this robbery against the law has provoked wrath and scorn, open preparations to rob by means of the law stir these protectionist censors to no anger. Yet what is the real difference? How much worse is the moral standing of the man who steals from the public by lying scales, than that of the man who gets his hands into the pockets of his fellows by virtue of the tariff? For our part, we prefer the avowed burglary to sneak-thievery masquerading as patriotism. If a powerful corporation, by dint of political bribery and secret influence, is allowed a "differential," or some other form of special favor, by statute, enabling it to mulct consumers to the tune of $40,000,000 or $50,000,000 a year, we have rather less respect for it, and for the process by which it enriches itself, than for the acknowledged pickpocket or "second-story man."

Names cannot cover up facts or alter morals. If it is disreputable to hire a weigher to falsify records, it is just as disreputable to "see Aldrich" and get your tariff duties "fixed" so that you can lawfully collect tribute from all your countrymen. The latter method is being pursued at Washington amid general applause; but when an unlucky Trust is caught doing practically the same thing lawlessly, we all rise up in horror. But cheating and oppression are what they are, even if legalized. The moral quality of a transaction is not changed by the fact that the unfair appropriation of another man's property may be authorized by act of Congress, and may be called our glorious American system of protection.

There have been exposures in Congress of the knavery of the sugar schedules, really as crushing in their way as the revelations before Judge Holt in court, yet no one gets excited about

them. They are simply the time-honored ways of cheating the people and calling it protecting infant industries. There is, to the discerning mind, just as much material for moral indignation in the taxes proposed in the woollen schedules, now under debate in the Senate, as in any disclosure of Trust stealing and tyranny ever made. Note, for example, how coolly a discriminating tax is defended which will wipe out a certain class of woollen manufacture. What is the difference between this and shutting up a sugar refinery by financial manipulation? When Mr. Whitman obtained his famous rates on "tops and dress goods," in the tariff of 1897, and got them by subterranean and abhorrent means, in what did his conduct differ from any other form of tapping the Treasury till and robbing the public? It was not, indeed, against the law, but no legalization of fraud can do anything except make it doubly disgraceful.

Not only fraud but heartlessness is written all over the proposed woollen duties. This was glaringly put in evidence during the hearings before the Ways and Means Committee. It was shown that the duties on wool and woollen goods compel the American workingman to pay a needless tax of 35 to 50 per cent. on the clothes he wears, or else to be hoodwinked into buying a coat made of shoddy which will fall in pieces the first time he is caught out in a hard rainstorm. It was proved, moreover, that a great proportion of the people who believe that they are wearing woollen shirts in winter are really wearing garments mostly cotton. Thereupon up spake Representative Crumpacker, a mighty defender of the noble American system of protecting the workingman: "What is the difference if they don't know it?" He might just as well have asked: "What is the difference if the government doesn't know that the Sugar Trust is stealing $2,000,000 in unpaid duties?" The veriest ditcher in England is treated with more decency than our cherished laboring classes. When Reuben Shillabeer crawls out of the water and asks David Bowden for a dry wool shirt, he knows that he will not get a thing nine-tenths cotton. Protection against the weather, protection against pneumonia and tuberculosis—these things go for nothing with our unfeeling protectionist Congressmen. Clap on the prohibitory duties and let the poor go in patches or in cotton—provided "they don't know it"!

Well, they are beginning to "know it" as they never did before. There has been a more thorough showing up in Congress of the essential greed and dishonesty of a protective tariff than we have seen for many a year. The work of the Western Republican Senators who are in revolt against Aldrich, has been of immense value. They have had their constituents and their State newspapers behind them, and the knowledge about tariff iniquities which has been spread abroad in speeches and biting editorial comment and mordant cartoons, has carried new light and provoked new heat. The fundamental nature of the protectionist demand is now better understood than at any former time. That demand is simply that Congress issue to favored individuals or corporations a license to tax—that is, to rob by law. Wealth heaped up by tariff privileges is, indeed, as was declared by Prime Minister Asquith the other day in Parliament, the really offensive "unearned increment." Whatever may be done with the unearned increment in land, the only thing to do with the unearned increment got through protective taxes is to abolish it. Instead of laws to facilitate disguised robbery, it is time that we had some to extinguish it.

SCIENCE AND CULTURE.

The scientist is disappointing some of our humanists, who think him the implacable foe of culture. They have been ranking him but little lower than the crass utilitarian, the pseudo-educator bent on making business colleges out of our high schools. But the scientist will not keep step in that file. President Maclaurin of the Massachusetts Institute of Technology made it clear, the other day, in his inaugural address. Science and culture, he affirmed, must go hand in hand, "science being studied and taught in such a way as to make for that broad and liberal outlook in the world that is the mark of a really cultured man." Here is the humanist's ideal, at least; and if it still leaves undetermined the question whether science alone can effect this kind of culture, we must bear in mind that it was spoken to engineers in a school where the lathes leave scant time for Theocritus. Hearing a plea to such an audience for "an ideal broad enough to form the basis for a sane criticism of life," the humanist should forgive President Maclaurin's very mild thrust at tradition that followed. He did not really turn the phalanxes of science against Greek and Latin, when he said a man need not pursue the "so-called useless studies" for mental discipline and culture, "if he can gain these excellent things in studies that are useful to his calling." Surely, this heavily conditioned remark need make nobody fear for the classics or any of the humanities; they have still the chance to prove their usefulness in training the mind for technical studies. And if President Maclaurin did not choose to say that the classics lay the surest foundation for general culture and even for special technical studies, many of his colleagues in science have done it for him.

Thirty-five of them have sent to Dr. Harvey W. Wiley, chief of the Bureau of Chemistry, some significant estimates of the value of Greek and Latin to the nature-student. Their opinions, which Dr. Wiley publishes in the current *School Review*, do much more than support his conclusion that, even in the laboratory, "there is a decided opinion to the effect that a knowledge of the classics is more or less indispensable to one who claims to be a man of culture and education." If these views are at all representative, they disclose a majority sentiment favorable to the tongues of Homer and Horace as "a basis for scientific study and activity." Only seven of the thirty-five deliver an unqualified verdict of "worthless." Two charitably say that all knowledge has some value. Three others think that the languages do not offer a fair return for the time spent in mastering them. Over against these, an even score rate Latin as "valuable" or "essential," while sixteen say the same of Greek. Only fifteen, however, can name some service which the classical languages alone render the scientist; the other five champions apparently suspect that French or German, or, perhaps, mathematics, furnishes, when properly taught, the same useful information and discipline. "What effect," asks Dr. Wiley, "will a fair knowledge of them have upon the pleasures which may be enjoyed?" Five reply that the classics contribute no special pleasure, five others that modern

languages are more delightful, while fifteen give strong praise.

These verdicts leave the humanist little reason to fear lest wisdom and joy die in a test-tube. Of all ways to culture, the classical tongues are those at which men of modern research are most inclined to look askance. But, as a matter of fact, the outcry against languages, literature, and history is not what it was a few years ago. It may be quite as loud as then, and we fancy it is perhaps shriller; but only because it has been taken up by many self-appointed educational authorities and over-zealous champions of vocational training. The deeper voices are leaving the chorus. When they were struggling for recognition, men of science said many strong things which, having gained their place within the academic fold and having come to face the problem of training young men, they have learned to repent. Culture is not the bogey that it seemed when it stood in their way. If they will not say to-day with Baur, the distinguished chemist: "Give me a student who has been taught his Latin grammar, and I will answer for his chemistry," they will at least stand on the platform just laid down by Attorney-General Wickersham for Lehigh University graduates. With him they perceive that our masters of scientific technique have not been taking the rank they should in our social and political life, because they have locked their doors against the ideals, the imaginations, and even the vicissitudes of mankind; because, in a word, they have sometimes forgotten that the heart of education is still the knowledge of man and not of things. If those masters themselves see this, our humanist need not shudder over Dartmouth choosing a physicist for president.

THE COUNTRY CHURCH.

Interest in the country-life movement has recently borne fruit, particularly as concerns the country church. Christian forces have been stirred to activity in the work of its regeneration. Theirs is no mean task; for the problem of the rural church is, in a measure, that of the community. It must impress the population flowing into our great centres, and it must also aid in making country life attractive for its own sake. Said the *Outlook* recently: "In influencing the development of country life, no other institution has the opportunity of the country church."

Greatest progress has been made where perplexity is most acute. Though Western rural churches know the path of difficulty, staid New England faces peculiar complications. Long-standing denominational strife, old family prejudices, alien invaders upon historic farms, and all the frictions of New England village life must be overcome. This spring, in Rhode Island, Massachusetts, and New Hampshire careful investigation has been completed under varied auspices into rural life, with special reference to the churches. In the New England Country Church Association we have a real move to solve the problem. Organized last August, this body has certain large objectives. Its avowed aim is "the social and economic improvement of the rural community through the agency of the rural church." It includes some of New England's best informed students of rural life, in its president, Professor Carver of Harvard, President Butterfield of Massachusetts Agricultural College, Dr. Wilbert L. Anderson, and others. With hopes of a unified Christianity and a peculiarly trained and adequately paid ministry, this new organization has started upon a campaign of education.

At the first public sessions in Boston recently, Professor Peabody declared that the problem was not to improve the country by measures imitative of city conditions, but to make the former desirable in itself. President Eliot unfolded a possible remedy for the discouraged churches in his plan of endowment, administered under a capable interdenominational commission. These two features, however, endowment and commission, have yet to be worked out; they present no small problem of their own. As a whole, the conference displayed a decided tendency to look upon sectarianism as the basic weakness of the country church, and to find that of the community as a whole in economic conditions.

The day has long since passed in which the country pastor was the village autocrat, and when the leading men in his church were the leaders in the town. The country pastorate has come to be regarded as "a convenient laboratory for the clerical novice or an asylum for the decrepit." The recent graduate from the seminary and the veteran pastor who must remain in harness even in declining years, will seek these lesser parishes. No wonder, then, that the Country Church Association should take up the cause of the country pastor. Last month, under its auspices, a four days' "institute" was held at St. Johnsbury, Vt., attended by representatives of six denominations: Baptist, Congregational, Episcopal, Methodist, Universalist, and Unitarian. The speakers included officials from Harvard, Yale, and all the leading seminaries of the section. This and a similar gathering at Hartford indicate a realization of the necessity for progress and adaptiveness, even in the smallest communities.

These facts, however interesting, may seem to make little demand upon the average city dweller, but he has his place in the problem. Particularly is this true in the vacation days. In the change to cottage and colony, as distinguished from hotel life, has come an increasing tendency on the part of summer visitors to enter somewhat into the interests about them. In many country, hill, and seashore towns of New England the local church looks forward to the summer season as a time of special prosperity. For these vacation weeks the church rejoices in new faces and enlarged resources. Pews in the old white meeting-house long unused are occupied on Sunday by well-groomed city folk. Social events, the music, the collection-box, all witness to an unusual presence. Yet when the generous guests depart, comes the real test to the little churches. Only a small group is left to frequent these weather-beaten edifices. If the summer friendships could only be continued, it would mean encouragement in the rural routine. The summer visitor has here a real opportunity, not only in practical brotherhood, but in the solution of a national problem.

RECENT GERMAN FICTION.

We have become accustomed to look every year for a new volume from the veteran Paul Heyse. Age does not seem to impair his amazing productiveness, nor a certain youthful idealism. Compared with the spirit of his work, that of his young contemporaries appears like senile cynicism. "Die Geburt der Venus" (imported by G. E. Stechert & Co.) is a fair illustration of what seems to be his creed, as it is that of Björnson's Parson Sang: the will to be-

lieve in what is best in mankind. Others have given us pictures of studio life that may fill the uninitiated with vague horror. Heyse chooses to present the clean rather than the seamy side. There will, of course, be no lack of critics and readers so sophisticated as to doubt the nobility of his hero and his heroine. Yet it is far more likely that an artist model could pose for the birth of Venus without loss of personal dignity than that a young woman deliberately seeking experiences in the maelstrom of modern Berlin could issue from them in stainless purity, as the creators of that much-favored type would have us believe. Yet the new novel of Heyse has its modern features. The sister of his hero is a thoroughly contemporary *Backfisch*, chafing under restraint, and eager to experiment. The question whether ignorance or knowledge of the realities of life is a better safeguard of virtue is touched upon, but the author wisely refrains from offering an answer. There are discussions of problems in art, of morals and religion, but they never interrupt the course of the narrative. The tragic end of the hero relieves the author from venturing upon the well-trodden field of marriage between artist and model. But, though he can be pardoned for making some of his characters faded reproductions of his early favorites, it does seem unpardonable that Heyse should share the chauvinism of his compatriots in making the villain and adventuress of his story foreigners.

The woman portrayed by Anna Reichert in her novel, "Der Roman der Marianne Vanmeer" (Egon Fleischel & Co., Berlin), is a genuine type of an unsettled transition period. She is a character deflected from the line of her natural development through an unfortunate early experience, and doomed to stray on devious by-paths, until by renunciation she arrives at self-realization in art. A highly complex individuality is this Marianne, who, with a vague longing for the fulness of emotional life, couples a cold-blooded curiosity and self-analysis. The record of her experiences is as pathetic as it is repulsive. Set in the frame of modern Berlin, her story acquaints the reader with many fads and freaks affected by a prosperous and sophisticated nation whose natural rationalism has been reinforced by the materialistic tendencies of the age. As a direct transcription of such phases of real life, the book has a place in the history of the morals and manners of the German metropolis.

Hanns von Zobeltitz's "Der heilige Sebastian" (Egon Fleischel & Co.) is the story of a *mésalliance*, which did not greatly tax his inventive powers. The high-minded young nobleman is as familiar a figure in fiction as the fascinating though vulgar variety actress whom he marries, in spite of his family's opposition. By way of contrast, the author introduces the ideal affection which another woman cherishes for the hero; but the reader who believes that the just should be rewarded and the unjust punished in the world of books, is disappointed to learn that the whole-souled Marga dies of consumption before the ill-assorted couple are legally freed.

Paul Oskar Höcker's story, "Die verbotene Frucht" (Egon Fleischel & Co.), is a deviation from the type of fiction which he usually cultivates, and which in Germany is ambitiously styled *Kriminalroman*. There is no crime in this novel to be tracked down by the detective. But does not Emerson say that society resembles police in citizens' clothes? Society has prying eyes, and the compromising situation in which the impulsive heroine places herself by her sympathy for the scapegrace of her husband's family is sufficient to rouse that body of private detectives to feverish activity. They forge a chain of circumstantial evidence most disastrous for her reputation. One is reminded of Echegaray's "Galeotto," as the two people whose names gossip has coupled in the time of their trouble become dear to each other. When long after her divorce the heroine discovers that nothing can convince the world of her innocence, she opens a letter from her supposed lover that she had not intended to read, and the end of the story might lead our Mrs. Grundy to pronounce an emphatic "I told you so."

In their preference for pathological subjects, German authors are rapidly exhausting the ordinary ills of flesh and soul. Now, a newcomer among them has hit upon a disease which superstition was wont to invest with miraculous powers, and which has long baffled medical science. Josef Zytlaun's "Krescenz Bühler" (S. Fischer, Berlin) is a sufferer from catalepsy. As a delicate child she witnessed a brutal scene that left her nerves unstrung, and a fall from a hayloft has made her an invalid. In her rural home among strangers she becomes the object of morbid curiosity. The efforts of the doctor and the priest of the village to unravel the secret of her illness are interesting. Her apparent death and subsequent revival are treated with a certain element of mysticism, but the author has avoided the field of miracles. There is a delicate hint that the invalid, in her vegetative condition, may be possessed of second sight, but lacks the power to express her visions. The author suggests admirably the transcendental atmosphere which envelops his heroine, and makes the robust peasants feel at her death as if they had been delivered from an invisible burden.

It is a relief to turn to a story which presents life under normal conditions. Alfred Bock has the reputation of being one of Germany's best writers of provincial fiction. His new book, "Die Pariser" (Egon Fleischel & Co.), is the story of a peaceful vendetta. The usury of the burgomaster has forced a part of the population of a Hessian village to emigrate. They seek their fortune in Paris, and when by hard work and frugality they have saved considerable sums, they vow to return and have vengeance on the man who had ruined them. The scheme succeeds, but when the man dies, they do not hesitate to show that their hatred has been absorbed by the native kindness of their hearts. There is a delightful love-idyl interwoven with the main plot.

Richard Huldschiner's "Starkenberg" (Egon Fleischel & Co.) is a story of mediæval life, full of the brutality and superstitions of a period when the Old World was swept by the scourge of pestilence. Huldschiner handles his material with the poet's imaginative insight and with great dramatic power. Whatever his sources for this story of brotherly feud, of the kidnapping of an innocent girl, and the ravages of the epidemic, he conveys the impression that he has lent a living voice to the old chronicles. Georg von der Gabelentz does not accomplish this end in his novel of Italian history, "Um eine Krone" (Egon Fleischel & Co.). We witness the outward manifestations of the will of the royal Joana of Naples and that forerunner of the Borgias, Durazzo, but we get scarcely a glimpse into their real character.

A story of immediate interest to the foreign immigrant in America is "Das grosse Tor," by Wilhelm Cremer (imported by G. E. Stechert & Co.). The hero comes to this country unprepared for its life of strenuous labor, ignorant of the language, and undecided in his plans. His life in the steerage is painted with a bold realism. His experiences on landing in New York are those of the average newcomer, and are recorded with sincerity. But the inferences which the hero draws from the impressions gathered, mainly on the Bowery, are commonplace and incorrect, though they may express the sentiments of many hundreds of foreigners, who, when they have barely passed the big gate of the New World, are ready to formulate their opinions of America and Americans in terms of bitter disapproval. The hero returns to Germany after a brief stay, one more in the ranks of the type which Kürnberger portrayed in his "Amerikamüde." The redeeming feature of the story is the heroine, who remains, and is one of those foreign immigrants whom one would not like to miss in this conglomerate of nations.

The consummate art of Thomas Mann has set its stamp upon every one of the stories contained in the sixth volume of Fischer's Bibliothek Zeitgenössischer Romane. "Der kleine Herr Friede-

mann," a hunchback who lives a quiet and resigned life, respected by neighbors and business associates, until a sudden infatuation for a frivolous society woman drives him to suicide, gives the volume its title and its cue. The book deals with morbidly sensitive and morbidly passionate natures. Mann is a psychologist studying types, but his portrayal of them proves that his knowledge is tempered with sympathy. The characters in the book are convincing, with the exception of "Tobias"; to the soul of this solitary the author has failed to furnish the key, and the story is the only one in the volume that suggests a touch of the pathological.

Three volumes by Otto Julius Bierbaum, entitled "Sonderbare Geschichten" (imported by G. E. Stechert & Co.), stand apart as representatives of the grotesque humor in which he reigns supreme. Though shocked by his coarse-grained language, the reader is whirled along by this bacchanalian and riotous fancy. But even in its most factitious exoticism and its most Rabelaisian moods, the humor of Bierbaum is sound at core. It is impossible to read much at a time in these curious stories; but they are a desirable protest against the pathological and the hyper-æsthetic tendencies of most German fiction.

A. von Ende.

NEWS FOR BIBLIOPHILES.

The "Census of Caxtons," by Seymour de Ricci, just distributed to members of the Bibliographical Society, is an admirable piece of work. It is not merely a list of books from Caxton's press, with the names of their present owners, but is a record of the history, so far as traceable, of every existing volume or fragment, with references to examples described in early sales catalogues and elsewhere, which cannot now be located.

The names of early owners are taken chiefly from the fly-leaves of the books or from manuscript notes. No doubt, evidences of such ownership of many copies have been destroyed by modern binders. The subsequent owners are shown by references to sales catalogues, the page and lot number being generally given. The present owner's name is printed in small capitals. The imperfections, presence or absence of blank leaves, and the condition, are next given, then the binding and the size. Then comes the list, in some cases a long one, of untraced copies, many of which are probably identical with copies described more fully under the previous heading. Following is a list of fragments, or single leaves, though this is, admittedly, very incomplete. Preceding these lists and descriptions of copies, there is, for each book, a short general note, giving:

(1.) The exact title of the book, in Caxton's own words and spelling.
(2.) The collation, number of leaves, and signatures, size of the type-page, etc.
(3.) References to Blades's great work on Caxton and to other bibliographical works.

Besides the books printed by Caxton at Bruges and Westminster, there are described three books printed at Bruges after Caxton's return to England, but with his types, two books printed by Guillaume Maynyal at Paris for Caxton, five books printed after Caxton's death by Wynken de Worde, but with his types, and, finally, a single book, John Kay's "The Siege of Rhodes," by an unidentified printer, but with types which may have been Caxton's. In all, there are 111 books and broadsides described, of which exactly 100 were of Caxton's own printing. The frontispiece to the volume is a reproduction of the Flemish engraving prefixed to the Chatsworth copy of the "Recuyell of the Hystoryes of Troye," which is supposed to represent Caxton himself presenting a copy of his book to Margaret, Duchess of Burgundy. There are also ten full-page facsimiles, showing the different types used by Caxton.

In one respect only can we criticise the work. It is unfortunate that the proof-sheets recording the history of books in America (other than Mr. Morgan's, which have been fully described by E. Gordon Duff) were not submitted to some American for revision. Without taking the time to make a minute investigation, we can correct the following errors:

The list of copies of Higden's "Polycronicon," 1482, should be reduced by two, and possibly three others should be added. No. 3 and No. 8 are identical, as are No. 4 and No. 76. The three additional are Bishop Hurst's, but of these, later.

The Towneley-Sykes-Dent-Perkins-Ives copy (De Ricci's No. 8) was not bought at the Ives sale in 1891 by the Boston Public Library. It was bought by a firm of booksellers, by whom it was sold (in 1893) to the Lenox Library, and is identical with De Ricci's No. 3. It is still in the Lenox Library.

Lord Charlemont's copy (untraced by De Ricci, his No. 76) was bought at his sale in 1865 by a New York collector, Almon W. Griswold, for £477 15s. It lacked two leaves, which were supplied by Mr. Griswold, who then sent it to Bedford to bind, telling him not to spare expense in the work. Bedford's bill for £50 for the binding was formerly with the book. But what a pity! The "old oak boards with leather buckle," perhaps put upon the book in Caxton's own workshop, and the old fly leaves, which might have contained records of successive owners, were thrown away! Is there a collector who would do such a thing to-day? Griswold was one of the keenest and most eager collectors of his day. He had been the underbidder on the first folio Shakespeare at the sale of George Daniel's famous library in 1864, letting that book go to Miss (afterwards Baroness) Burdett-Courts for £716 2s, four times any previous record on the book, and a price that was not exceeded for more than a quarter century. We may presume that the price paid by him for this Caxton (lacking two leaves) was an equal surprise to his contemporaries. Lord Charlemont's books had been mostly destroyed in a fire at Sotheby's, after they had been catalogued for sale, but this fine Caxton survived. In 1888 Mr. Griswold sold the volume to a New York house, who priced it in a catalogue, dated October of that year, at $6,750. It was purchased by Robert Hoe, and is one of the most prized books in his great library. Its history seems to have been unknown to the compiler of the Hoe catalogue, who says: "Blades records five perfect copies only, some of which are made-up. This one appears to have escaped his notice." Although the Charlemont-Griswold-Hoe copy is a "made-up" copy, it is undoubtedly the finest copy known, having more than two hundred untrimmed leaves. The Hoe copy is De Ricci's No. 4.

There is another error in regard to the "Polycronicon"; the Astor Library copy (now at the Lenox Library building), described by Blades and De Ricci (his No. 6), as perfect, has several leaves in facsimile.

Three very large fragments of the "Polycronicon" were in Bishop John F. Hurst's library, Part IV, sold at Anderson's in March, 1905. Not counting blank leaves, one copy lacked 144 leaves, the second 151 leaves, and the third 239 leaves. A perfect copy has 450 leaves, of which five are blank. The best of the Hurst copies was again sold in one of the Poor sales the past winter.

The fine copy of Gower's "Confessio amantis," 1493, now in the Hoe library, was bought in the Earl of Jersey's sale in 1885 for Mrs. N. Q. Pope of Brooklyn, and passed with other books into Mr. Hoe's collection in 1895. Mr. De Ricci notes only one Caxton (the famous "Morte d'Arthur") as having belonged to Mrs. Pope. He gives the heading "Abby E. Pope," and, mistaking the sex of the owner, says, "His widow sold his library to Robert Hoe." It was shortly after Mrs. Pope's death that her husband sold the library. A somewhat similar error occurs under the heading "Locker-Lampson's collection, at Rowfant." De Ricci says, "Sold in 1905 (?) to Church, who resold part of it to Dodd, Mead & Co." The fact is that these booksellers purchased the library entire and sold it entire to the late Mr. Church, who selected the Shakespeares and such other books as he cared to retain, leaving the rest with them to be sold for his account.

As a contribution to that fascinating subject, the history of book-collecting, this "Census of Caxtons" is one of the most interesting books ever written.

Correspondence.

A NEW PARTY.

To the Editor of The Nation:

Sir: The editorial, "The People Losing a Weapon," in the issue of the *Nation* for May 20, clearly sets forth the unfortunate condition of our politics resulting from the practical disintegration of the Democratic party and the consequent loss to our political life of a true opposition.

It is evident to one who studies the signs that one of those upheavals that from time to time disturb the orderly course of events is imminent. This is presaged by the present state of affairs political, of which the most suggestive features are:

(1.) The apparently unassailable position of the Republican party.

(2.) The apparently hopelessly impotent condition of the Democratic party.

(3.) The abandonment by the Democratic party of its principles and its adoption of principles which it has been supposed to be opposing.

(4.) The fact that political and economic

lines are not drawn the same as party lines, and the existence of radical factions in both parties that are much closer to each other than they are to the conservative faction in their own party, and

(5.) The existence of conservative factions in each party which, while having less resemblance to each other than the radical wings have, are more sympathetic toward each other than to the other faction of their own party.

What is more probable than that a new political alignment will take place based on conservative and radical lines? This seems to be the natural division of parties. A little examination of conditions will show that a new party, or a reorganization of the Democratic party, can be made along such lines that will put new vigor into our political life.

I expect this movement to arise within the radical faction of the Democratic party, meaning those who believe in progressive legislation based on the old principles of Democratic faith, and not faddists, socialists, or mere opportunists, whose only idea is to regain or retain office. The cardinal Democratic principles which must be considered for the new party are:

Strict Construction of the Constitution.
States' Rights.
Economy and Efficiency in Government.
A Low Tariff, and
What may be termed broadly as Opposition to all Special Privileges.

(1.) The first of these principles has ceased to be sufficiently alive to cause dissension. But as it affects the policy of internal improvements, "imperialism," extension of Federal power, and some similar questions, it still has vitality.

(2.) States' rights under the old guise of State sovereignty has ceased to live, except in the hearts of a few irreconcilables. But as representing local self-government in opposition to extension of Federal control, it should be a cardinal principle of any new party that rises from the ashes of the Democracy.

(3.) Economy and efficiency of government are strictly in accord with Democratic principles, are not opposed to Republican principles, and will be a mighty factor if consistently upheld. It means a small and efficient army, all of whose members, officers as well as soldiers, are expected to attend to their strictly military duties; a small and effective navy; abandonment of expensive and useless outlying possessions; civil service reform carried to its ultimate bounds; a careful watch on our expenditures in a thousand and one ways such as those above outlined and in pension bills, river and harbor bills, and building canals.

(4.) A tariff for revenue is the true Democratic doctrine, but the protective principle has become so firmly established of late years, owing to the lack of an effective opposition, that it would unquestionably be more expedient to advocate a substantial reduction of tariff duties rather than an abandonment of the protective principle.

(5.) And the last tenet will command a very large support as the feeling is growing stronger every year that there are too many special privileges recognized and even protected by the government. The new party must oppose all forms of privilege. It must represent the people, not the common people or the uncommon people. The Republican party represents the rich, and there is growing up a Labor party and a party of the proletariat. The new party must take all the American people for its *clientèle*.

Direct primary elections and perhaps other similar or even more advanced methods, will doubtless appeal to the new party, since to develop its greatest strength it must keep close to the people.

If the above lines are followed it is believed by the writer that a live party can be created, which will create enthusiasm, attract adherents, and which will have a long and successful career, because it will be based on living principles. It will reanimate all politics by creating an effective opposition; it will cause its opponents to see the need of reforms that they have heretofore opposed; it will be the means of forcing its opponents to do many things it cannot itself accomplish.

There is nothing in the policy outlined above that would prevent progressive Republicans from supporting the party that adopts it. Indeed, it is nearer to the principles of those Republicans than is the policy of the Republican party itself.

WM. P. MALBURN.

Denver, Col., May 26.

A RETREAT FROM MARATHON.

TO THE EDITOR OF THE NATION:

SIR: Χαίρετε, Νικᾶτε! The whole theory of pure Browningesque invention for the Marathon run falls breathless, as is clearly shown by the replies to my letter printed in the *Nation* of May 27.

Among the works of reference to be corrected or completed to this effect are apparently all the Browning hand books. See at least G. W. Cooke's, p. 290 ("This part of the poem is probably original"), where Mrs. Orr and Symons are cited as if in agreement. If the old Pauly Reallexikon knew anything of all this, the Smiths failed to "lift" it into English, and so excellent a school manual as Lübker was silent, down to 1882. The essay mentioned in my previous letter is reprinted in the "Boston Browning Book," and the present retraction covers the same error there (p. 386.).

It may still be worth noting, that only a probable surmise as yet identifies Philippides, the runner of Marathon so named first by Lucian, with Pheidippides, the courier to Sparta. The fatal run itself was apparently believed in as early as 300 B. C. (Heracleides Ponticus apud Plutarch), and there may be an earlier passage still to offer. The multiplicity of names may be partly because Philippides or Pheidippides looks like a mere patronymic (from which Nepos drops the ending) rather than a true individual name. Until further evidence is offered, Lucian, a very late author, is the first who in any way suggests that the two runners were the same person.

But as for Herodotus the *argumentum ex silentio* still seems safer than usual. If, sixty years after the battle, any such tale had been current, surely the chronicler would have heard it from his Athenian friends, and used it to gild his rather meagre record of the first Persian invasion. The late appearance of so picturesque a story stamps it as probably a poetic or mythic invention.

Browning apparently added the artistic and ethical link—uniting the two incidents. Pan promised the runner "A worthy reward . . . release from the racer's toil." But the god's prophetic word is as usual ill-understood. Not ease, long life, "children close to my knees," was meant, but instant death on the crest of supreme achievement. Herodotus puts into Solon's mouth a similar tale of Cleobis and Biton, which seems to have influenced Browning powerfully.

This is not properly a proof of a melancholy view of life. The early martial lyric also emphasizes the fitness of heroic death in youth for fatherland and honor's sake. Not that life is less, but victory more precious; and a supreme success is so rare that man may well be content with one such day, or even fear to mar its glory, as Miltiades so soon did, if he lives on. Yet even the Herodotean Solon had given the *first* prize of happiness not to the dutiful and short-lived youths, but to the patriarch Tellos, borne by sons and son's sons to a hero's grave.

And the prize must be worth the price. Once Pheidippides runs to save Athens, and again to bring exultation, before the dreaded night descends, to myriads of affrighted hearts, though his own should burst.

But—μηδὲν ἄγαν. For an ordinary test of speed the stadion was severe enough, and eight or ten furlongs was already a long-distance race. To send striplings or even young lads, on a nine-league race as a mere amusement, is most un-Hellenic. So much may still be maintained; our deadly "Marathon race" has no classical origin nor modern justification. W. C. LAWTON.

Scranton, Pa., June 7.

MR. BURBANK'S WORK.

TO THE EDITOR OF THE NATION:

SIR: In the issue of the *Nation* for May 27 mention is made of Jordan and Kellogg's "Scientific Aspects of Luther Burbank's Work," and the reviewer wonders that so unsatisfactory a story had been put forth, and asks why the real case is not more clearly stated.

The fact is, as Messrs. Jordan and Kellogg so well know, there is no "science" or "scientific aspect" to Mr. Burbank's work. They have made the best story that could be made in the case. Until the newspaper writers got hold of some of Burbank's accomplishments and exploited them reporter-like, neither Burbank nor any one for him had ever claimed he had anything to do with science. He was merely a selecter of what seemed to him best, and that was all. He would sow 100 or 1,000,000 seeds of a given sort, and when they grew he would select 1 or 10 or 50 of the plants that looked the best and most robust, and would then bring them into flower or fruit so as to get an article that was superior to the original. He called this cultivation "educating the plant," and had no idea that he was more than a simple selecter. (I am not referring to his hybrids; he did hybridize, as many others have, and by that means got crosses as hundreds of other people have done.) The newspaper reports took up the selective part of the work and on that have given him fictitious reputation. Mr. Burbank in the beginning was not to blame for this, as it was not only done without his consent but in despite of his protests. Now, however, he may be

to blame in so far as he has not publicly repudiated the error. He has suffered in the eyes of scientists for apparently endorsing what he and they know to be a fraud.

JACOB THOMPSON.

Chicago, June 1.

ONE PHASE OF IMPERIALISM.

TO THE EDITOR OF THE NATION:

SIR: At a meeting of the Twentieth Century Club of Boston, May 29, the subject of discussion appears to have been the Hawaiian Islands. Mr. Gorham D. Gilman, according to a report in the Boston morning papers of Monday, May 31, said:

The most serious question now is, whether the Hawaiian people are capable of self-government. It is doubtful if a legislature composed of them would be able to enact proper laws at present; but I believe this problem can be worked out in time.

The Rev. C. F. Dole, the chief speaker of the evening, touched upon one phase of the Hawaiian question, being thus reported:

A serious difficulty noted by Dr. Dole was that concerning the liquor law. It had worked well for one year, but an attempt to change it in favor of the saloons was made in the Legislature last winter by white men. The Hawaiian native members of the House, however, stood together against the change, and it was defeated.

Are the white men in Hawaii yet fit for self-government?

ALEXANDER F. CHAMBERLAIN.

Clark University, Worcester, Mass., June 4.

Notes.

A fourth volume has been added to the works of George Eliot in The World's Classics (Henry Frowde), containing "Scenes of Clerical Life."

The excellent two-volume edition of the works of Charles and Mary Lamb, edited for the Oxford Press by Thomas Hutchinson, has now been issued within a single pair of covers, printed on thin paper. The type is clear and the general form agreeable.

B. W. Huebsch has secured the American rights of Sudermann's novel "Das hohe Lied," and will publish a translation of it in the autumn, under the title of "The Song of Songs."

Some time this summer the Scribners will bring out "Chateaubriand and His Court of Women," by Francis Gribble, a companion volume to his studies of Rousseau and George Sand.

Next month A. C. McClurg & Co. will publish a life of the inventor of the Harvester, under the title "Cyrus Hall McCormick, His Life and Work," written by Herbert N. Casson.

Grant Richards of London has ready a volume of "New Poems," by Madison Cawein of Kentucky. Mr. Cawein's poetry is probably better known in England than it is in this country.

We are to have, in the autumn, another library of selections from the great prose writers, to be called "The Best of the World's Classics." The editor-in-chief is Senator Henry Cabot Lodge, and the work will be published in ten volumes, by Funk & Wagnalls Company.

Houghton Mifflin Company announces two historical works for publication next autumn, which promise to be interesting: "The Life of Richard Brinsley Sheridan," by Walter Sichel, based on a large amount of new material; and "The Girlhood of Queen Elizabeth, Told in Contemporary Letters," by Frank A. Mumby.

Lemcke & Buechner announce a new Propyläen-Ausgabe of Goethe's Sämtliche Werke to be completed in forty volumes of about 500 pages each, to be issued at the rate of seven volumes a year. All that Goethe meant to be printed will be included, together with a representative selection from his letters and diaries. The text, based on the Weimar edition, will be edited by competent scholars and arranged in chronological order.

The Arthur H. Clark Co. of Cleveland, O., announces for autumn publication a ten-volume series entitled "Documentary History of American Industrial Society," upon which the American Bureau of Industrial Research and the Carnegie Institution of Washington have been engaged for a number of years. The series will comprise a Preface by Prof. Richard T. Ely; an Introduction by Prof. John B. Clark; Vols. I-II, "Plantation and Frontier," by Prof. Ulrich B. Phillips; Vols. III-IV, "Labor Conspiracy Cases, 1806-1842," by Prof. John R. Commons and Prof. Eugene A. Gilmore; Vols. V-VI, "Labor Movement, 1820-1840," by Prof. Commons and Helen R. Sumner, Ph.D.; Vols. VII-VIII, "Labor Movement, 1840-1860," by Professor Commons; Vols. IX-X, "Labor Movement, 1860-1880," by Professor Commons and Dr. John B. Andrews. Volume X will also include an exhaustive Analytical Index.

The "Concordance to Wordsworth," which has been in preparation for the Concordance Society, is now virtually finished, though as yet no definite steps have been taken to secure its publication. The work has been done under the direction of Prof. Lane Cooper of Cornell University, with the help of over forty collaborators. The text is based upon that of Hutchinson's Oxford Wordsworth, supplemented by the editions of Nowell Smith and Knight. For the most part, the quotations have not been transcribed, but cut out and mounted from the printed page. This ought to insure a high degree of exactness in such matters as punctuation and the use of capital letters. Only the commonest words, particles and the like, have been omitted. In all, there are about 200,000 entries. It may surprise some persons to learn that in Wordsworth's poetry the references to *man*, and similarly to *mind*, are considerably more numerous than those to *nature*.

The Bibliographical Society will meet at Bretton Woods, N. H., July 3. Its programme is as follows: "Address of the President," William Coolidge Lane, librarian of Harvard University; "Some Bibliographical Puzzles in Elizabethan Quarto Plays," Prof. George P. Baker, Harvard University; "English Dictionaries before Webster," Percy W. Long, Springfield, Mass.; "Calendaring of Manuscripts," Worthington C. Ford, Massachusetts Historical Society; "Bibliographical Progress in Italy," A. Fanti, Library of Congress.

No. 4,000 of the Tauchnitz Edition is set apart in that series as a Memorial Volume, and is devoted to "American Literature." It has been prepared by Theodore Stanton in collaboration with members of the faculty of Cornell University, it is appropriately dedicated to Mr. Roosevelt, and an American edition has been issued by G. P. Putnam's Sons. As the title indicates, it is a "Manual," and, although some competent criticism is to be found in its pages, it will doubtless be chiefly used for purposes of occasional reference. Even for a book of its kind, it is exceptionally lavish in names, titles, and dates, which seem to be given with commendable accuracy. There is also a full index. The only purchaser who, we should think, might have a right to complain of the volume is a would-be student of our literary evolution. After Mr. Stanton has condensed in five sections the volumes on colonial and revolutionary literature by the late Moses Coit Tyler, the Cornell collaborators take up the nineteenth century in six sections, beginning with the historians and ending with the journalists. Thus one reads of Parkman before hearing of Cooper, and Henry James, jr., precedes his father—except in the index. Even within the sections themselves one's sense for chronology is occasionally shocked. For example, the treatment of Lanier as a poet precedes that of Longfellow. This seems to be due to some respect for the points of the compass, but not even those irreproachable guides are consistently followed. Such matters of arrangement do not, however, greatly disturb some readers, and they do not detract, thanks to the index, from the considerable value of the book as a work of reference. It should be added that a positive announcement is made in these pages that Henry Adams wrote the novel "Democracy," and that the late John Hay wrote "The Bread-Winners."

Mrs. Caroline Atwater Mason has produced in "The Spell of Italy" (L. C. Page & Co.) an entertaining book. It is more than the travel notes of an enthusiastic foreigner; for Mrs. Mason had evidently prepared herself by reading to see and enjoy much. She stayed long enough in the chief places to get more than a hasty impression of them; she made interesting acquaintances from whom she drew information about present conditions; and she has a level head. Her book may be recommended to readers who desire something less impersonal than Baedeker, and less prolix than most of the histories. They will find told here briefly, for instance, the story of St. Francis and of St. Catherine of Siena, and of many more. A large number of well-chosen half-tones help the reader to visualize the text.

Oliver Maddox Hueffer has compiled a chatty collection of anecdotes about witches and the superstitions connected with them, which he entitles "The Book of Witches" (John McBride Co.). It has no pretensions to thoroughness, and is disfigured by a superficial introduction on the possible revival of witchcraft, mixing up "Leo Taxil's" inventions about the revival of Satanism in Paris with the much more significant survivals of belief in witches among the peasant-folk of to-day. The arrangement of the book is confusing. History and analysis have been mixed up in haphazard order,

while the rather pretentious bibliography includes works of fiction and Blackstone's commentaries, yet omits Soldan, the standard book on the subject. Altogether, the book cannot be commended for any thoroughness of treatment, but is fairly readable and amusing.

The need of an annual bibliography in which shall be registered all books and articles, of any value or importance, relating to American history and published in a given year, has been acutely felt by many investigators. Yet the effort to provide such a bibliography has met with many discouragements. Continental countries have little difficulty in providing such an apparatus for the use of students and readers, but publishers in America seem to feel that such an undertaking is likely to be most conspicuous on the wrong side of the balance sheet. Even the American Library Association and the Carnegie Institution of Washington failed to continue a work of this character which each had begun. Therefore, it has been left to private coöperation, a very uncertain form of support and only rarely permanent, to take up the matter. Six individuals and ten historical societies raised a fund sufficient to guarantee the publication of annual volumes for five years, from 1907 to 1911, inclusive. The first volume under the new management has already appeared, covering the output for 1906, and the second volume is announced for immediate publication. The chief editor is Miss Grace Gardiner Griffen, who has done her work admirably. The entries, nearly 3,500 in number, cover books, pamphlets, and articles in periodicals, and are frequently accompanied by notes and comments. There is ample room for a publication of this kind, and it should receive adequate popular support. ("Writings on American History," 1906, the Macmillan Co.).

Rather more than half of William P. Pickett's "The Negro Problem: Abraham Lincoln's Solution" (G. P. Putnam's Sons) is taken up with a preliminary survey of the condition of the negro in the United States. Aside from its merits as an orderly and not too vehement presentation of facts and arguments, this part of the book may be dismissed without comment, further than to say that it expounds frankly, and without novelty, the radical Southern view of the negro as hopelessly inferior to the white, incapable of assimilation or even of satisfactory adjustment, and as the baleful source of political, social, and economic disturbance. For most of the numerous "solutions" thus far proposed, including that of industrial education, Mr. Pickett has but little respect, since, to his thinking, their main premises are erroneous. The remedy which he extracts from Lincoln's writings, and to the exposition and defence of which he consecrates more than two hundred and fifty solid pages, is colonization, preferably in South or Central America, San Domingo, or Africa, at the expense and under the protection of the United States. When a writer has thoroughly convinced himself, that the deportation of some ten millions of persons, at a cost to the nation of several hundred millions of dollars—Mr. Pickett proposes an initial appropriation of a hundred million as a "flyer"—is within the bounds of practicability, argument *contra* is obviously useless. What can be added to the century of discussion that has already been wasted? We venture only the remark that the American Colonization Society, though long in a state of innocuous desuetude, is still in existence and might well, perhaps, be consulted.

A commission connected with the Municipal Archives of Bordeaux is the patron of the new monumental edition of "Les Essais de Michel de Montaigne" (Paris, H. Champion). The editor is Prof. F. Strowski of the university faculty, famous for his great work on Pascal. The second volume of the Essays (668 pages, 25 francs) has appeared.

In handy editions of extracts from voluminous elder writers, of whom everybody should know something, we have "Pages choisies" of Fontenelle (Armand Colin), and "Helvétius" in the "Plus belles pages" collection (Mercure de France), both properly edited with introduction, notes, and bibliography.

Doris Gunnell, an Englishwoman, has done original work in her doctor's thesis at the Sorbonne—"Stendhal et l'Angleterre" (322 pages, Charles Bosse). The book chronicles all that can be ascertained, mainly from Stendhal's copious notes and letters, concerning his visits and friends, Byron and Brougham, Lady Morgan, and Miss Clarke and Sutton Sharpe, with his own curious views on people, politics, taste, and defects.

Auguste Filon, in his new edition of "Mérimée et ses amis," publishes a bibliography of his hero's complete work, drawn up by the late Vicomte de Spoelberch de Lovenjoul and revised by F. Chambon, librarian of the University of Paris.

That inexhaustible author, Remy de Gourmont, publishes a third series of his "Promenades littéraires," with Huysmans (personal recollections), Chateaubriand, Brunetière, the Romantics, and others back to the *Libertins* and Cyrano de Bergerac (Mercure de France).

Count Joseph de Mailath, introduced by Professor René Henry of the École des Sciences politiques, publishes "La Hongrie rurale, sociale, et politique" (Alcan). The veteran Pacifist, Frédéric Passy, in his advanced old age, finds energy to prepare the notes and documents of yet another volume, "Pour la Paix" (Fasquelle).

Two handbooks of great value to students of French contemporary history are among the new publications. "Éléments et notions politiques de droit" is by Henri Michel, a Paris magistrate; he treats of the judicial organization of France, procedure, the jury, civil law, marriage and divorce, contracts, notarial acts, etc. (A. Colin). "L'Administration de la France" (Perrin), by Henri Chardon of the Conseil d'État, explains "functionaries"—in the public services, those attached to government, and 800,000 others—with the general regulation of the different administrations, and the necessity of a rational and democratic organization of all such services. The present year, with its postmen's strike, has shown how burning such questions are in France of to-day.

In "La Caverne," Ray Nyst, whom we take to be a Belgian scholar, has set out to depict, in a form approaching fiction, the beginnings of human society on the European continent. He has gone about his task conscientiously. His title page informs us that we are about to read the "picturesque story of a human family of twenty-nine persons, girls and boys, big and small, during the epoch of luxuriant tertiary forests and mild seasons in Central Europe." A formidable piece of scientific apparatus in the form of a critical introduction prepares us for the narrative proper, which is largely a re-statement of the facts in concrete and somewhat imaginative detail. For an amateur novelist M. Nyst does very well indeed. By emphasizing the close ties that bind his primitive man to brute creation, he succeeds only the more in concentrating our attention upon the process of human growth that went on in cavern and treetop. Something of the ancient sacred pity and wonder is stirred in us when our writer represents the she-bear and the human female so apparently close together, yet called by mysterious forces to such vastly separated destinies. What Becker did for the ancient world in "Gallus" and "Charicles," M. Nyst has done effectively for Eoanthropos. (London: David Nutt.).

Not since the publication of Haym's touching story of his long, hard struggle through poverty and revolution, up to his position of honor and influence at Halle, has there appeared in Germany a work of biographical interest equal to that of Friedrich Paulsen's "Aus meinem Leben" (Jena: Eugen Diedrichs). Unfortunately, it is but a fragment of the entire autobiography planned by the famous Berlin professor, covering only the period from birth through his first years as a docent. Two things make the work unusually valuable: the trying experiences of Paulsen, himself later a leading authority on German universities, with the formation of the higher educational system, and the frank and delightful narrative of a life begun in a peasant's cottage and continued, for a while, amid lowly but healthful country surroundings. There is no disposition to hide or tone down the past; Paulsen rejoices in his homely origin, and finds naïve pleasure in telling his readers all about it. "I grew up in a genuine peasant cottage," he says, "was taken into the school by an excellent teacher, and prospered in a light-hearted community and society." He describes his parents and grandparents, of good old Frisian stock, recalls the memories of early childhood, the games and companions and the first school he attended, and in two or three chapters gives a picture of the housekeeping of that time, with the work outside and within the peasant's cottage. All these reminiscences of the more personal side of Paulsen's life are made doubly interesting by the illustrations of his birthplace and home, with portraits of his parents in their Frisian garb, and of Paulsen himself as a boy, as a docent in 1877, and as he appeared near the end of his life. Paulsen was a good observer, and had a vein of rich humor; he deplored many of the changes going on in society to-day, and evidently wished, in this work, to raise up a monument to a past that is steadily fading away.

The Rev. Edward Everett Hale died on Thursday of last week at his home in Roxbury, Mass. He was born in Boston, where the Parker House now stands, on April 3, 1822. His grandfather, Enoch Hale, was a brother of Capt. Nathan Hale of tragic Revolutionary fame. His father, Nathan

Hale, was a man of liberal education and great puhlic spirit; a civil engineer, and also the editor and proprietor of the Boston *Advertiser*. The story of Edward's childhood, youth, and early training is told in his "New England Boyhood." Something must certainly he deducted from his depreciation of hoth the Boston Latin School and Harvard College as he found them from 1831 to 1839, hut his account of them is interesting, and one that will serve to give the *laudator temporis acti* needful pause. For all marking systems and examinations he had great contempt. Clearly he was apt at learning, and, though not a Franklin-Medal boy at the Latin School, he entered Harvard without conditions midway of his fourteenth year. A distaste for regular studies and conventional methods which is strongly reflected in his "New England Boyhood," prevailed against his entering the Divinity School. From 1839 until 1846 he enjoyed a varied experience of work and study. In 1846 he became a minister of the Second Unitarian Church, in Worcester, Mass., then newly organized and called the Church of the Unity. He remained in Worcester ten years, and in 1856 accepted the charge of the South Congregational Church in Boston, and held it for the remainder of his life, availing himself of the services of an assistant minister from 1886 onward. Early in his ministry he took a high rank in the Unitarian fellowship. His presence was commanding; his guttural voice extremely powerful and impressive, with a wide range from the most gentle to the harshest notes; his sermons ethical in their substance, and vivid in their style. The theological differences among Unitarians had little interest for him except as endangering "the unity of the spirit," and his chosen part was to manifest a liberality which included both extremes. He was Dr. Bellows's right-hand man in the formation of the National Unitarian Conference in 1865, and was the first secretary of that organization, and more than once the president of its council, retiring finally in 1893, when the long controversy concerning the theological terms of the constitution came to an end. Neither to repudiate Christianity nor to define it was the position to which he held throughout the long dehate.

To the puhlic at large Dr. Hale was better known as a writer of general interest than as a clergyman. From first to last he published nearly fifty books of different kinds—volumes of sermons, novels, social, and historical works. In the realm of fiction his success was much greater with the short story than with the elahorate novel. Two of his shorter stories stand out from all others, "The Man Without a Country" and "My Douhle, and How He Undid Me." The former was probably the most popular short story written in America. It first appeared in the *Atlantic Monthly* of December, 1863, and gave effective expression to the patriotic temper of the time, but some have thought that it goes near to teaching the doctrine, "Our country, right or wrong." Many at first imagined the story to be a veritahle history, and several who had known the hero endeavored to set the author right in some of his details. "My Douhle, and How He Undid Me" was merely a piece of excellent fooling. Of books midway hetween stories and novels Dr. Hale's "Ten Times One Is Ten" (1870) and "In His Name" (1874), have been the most widely read. The former showed how fast a social henefit might spread if every individual should help ten others, or ally himself with them, and the ten do as they had been done hy. He was one of the preachers of Harvard and one of its Board of Overseers. He was at one time editor of the *Christian Examiner*, and he originated and edited the *Old and New Magazine* much to his own financial detriment, and that of those associated with him in the enterprise. He hecame chaplain of the Senate December 14, 1903. The selection was made at the instance of Senator Hoar, who had been his lifelong personal friend. During the greater time of his term of office Dr. Hale used Senator Frye's committee room as an office. As long as he was able to do so, Dr. Hale made it a practice to visit the Senators at their seats, and he was personally known to all of them.

Moses King, publisher and author of "King's Handhook of the United States," "King's Handhook of New York," and a dozen other similar publications, died in New York, June 12, at the age of fifty-six. He was born in London and came to America at the age of five years.

George Wehh Appleton, the dramatist and novelist, died on Saturday at his home in Highgate, London. He was born in New Jersey in 1845. He travelled extensively in Europe, was newspaper correspondent in Paris and Rome, and founded the lecture hureau system in England. "The Blue Diamond Mystery," a novel, and the plays "The Co-respondent" and "Zana" are among the better known of his productions.

Dr. Benjamin Lawton Wiggins, vice-chancellor of the University of the South, at Sewanee, Tenn., died at his home there Monday. Dr. Wiggins was horn in Sand Ridge, S. C., in 1861, and received his primary school education at the old Porter Academy in Charleston. After leaving there he went to the University of the South, where he was graduated with the degree of master of arts in 1882. After a post-graduate course of two years at Johns Hopkins University, Dr. Wiggins returned to the University of the South, taking the position of associate professor of Greek, and later hecoming full professor. In 1893 he was elected vice-chancellor of the institution. He was active in the affairs of the Southern Intercollegiate Athletic Association in securing safeguards against professionalism and in purifying student athletics.

The death is announced in his seventy-first year of George Robert Elsmie, at one time assistant commissioner in the Punjab, judge in the Chief Court, 1878-85, and financial commissioner, 1887-93. He puhlished a number of books, including: "Epitome of Cabul Correspondence" (1864), "Notes on Peshawar Crime" (1884), "Lumsden of the Guides" (1899), "Field-Marshal Sir Donald Stewart" (1903), and "Anne Shepherd of Elsmie" (1904).

From Sydney comes news of the death of the Rev. Dr. James Egan Moulton, the well-known Methodist apostle to Tonga, hrother of Dr. R. G. Moulton, professor of English literature at Chicago University, of the late Rev. Dr. William Fiddian Moulton, one of the revisers of the Bible, and of Sir J. Fletcher Moulton, late lord justice of appeal. His great work was the translation of the Bible into the Tongan language. He was born near Newcastle, England, on January 14, 1841, was educated at Kingswood, and went to Tonga about 1864. The translation of the Bihle occupied him some twenty-five years. He also compiled a hymnal in Tongan, and provided a voluminous literature in translations and original works. Dr. Moulton left Tonga in 1889, and went to Sydney, where he was for a long time president of Newington College.

Dr. Karl Lohmeyer, professor of history at the University of Königsberg, has died, at the age of sixty-six. He was a notahle example of success in life, despite a physical handicap, as he was born without arms. Among his publications are "Geschichte von Ost- und Westpreussen," "Herzog Albrecht von Preussen," and "Geschichte des Buchdrucks und des Buchhandwerks im Herzogtum Preussen."

From Munich comes the report of the death of the Catholic historian, Johannes Nepomuk Sepp, at the great age of ninety-two. He has to his credit a long list of works in German, Oriental, and religious history, hut was known to the wider public for his opposition to the influence of the famous Lola Montez in the Bavarian university in the time of Ludwig I.

THE WESTWARD PATH.

The Romance of American Expansion. By H. Addington Bruce. New York: Moffat, Yard & Co. $1.75 net.

This book, the chapters of which were originally contributions to the *Outlook*, is, as might be expected, buoyant, vigorous, and optimistic. Mr. Bruce is well-satisfied with what we have done and very cheerful over our prospects, and to read him is an encouragement to hope; but his work shows lacks and lapses which disappoint, and we cannot altogether trust his guidance.

First, it is odd that, in treating the Romance of American Expansion, he makes no mention of what is the most picturesque circumstance connected with it, namely, that it is but an incident in a vast ethnic movement, beginning far back in prehistoric times, and having for its theatre the Eastern as well as the Western hemispheres. Fifty years ago, Max Müller and his fellow-scholars talked with great confidence of a primeval race, the Aryans, living among the highlands of central Asia, whose language it had been so far possible to recover that we could know with some definiteness the material civilization they had attained and the features of their intellectual and spiritual life. This primitive hive-swarming sent its multitudes southward into India, and also westward in successive swarms into Europe; at last, Greek, Latin, Celt, Teuton, and Slav, becoming fixed each in its European habitat, and history now beginning, the impulse westward, active since the days of the early

world, drives the Aryans across the Atlantic, to repeat in America the rude displacement of aboriginal tribes, a process going on throughout the entire long march from the original home at the feet of the Himalayas. While scholars at present talk with much less confidence than once of Aryan origins and relationships, dismissing as quite unascertained the position of the first Aryan home and holding as most shadowy all speculations as to early Aryan culture and migration, nevertheless the evidence is good of a migratory movement originating in the remotest past, in general a pouring westward, of which the European overflow into America beginning with Columbus is only a continuation. The march of Aryan empire has in later days been quickened by the subjugation of natural forces; it is, however, but a repeating of what has gone before—Latin, Teuton, Celt, and Slav, now under Anglo-Saxon leadership and organization, advancing to the possession of the continent, and later to the islands of the sea. This mighty prelude to American expansion is full of romance, and more. The story of it needs to be borne in mind in order to understand the inevitableness of the advance. It has been gathering momentum—as the result of an unrest that has prevailed since remote antiquity. Mr. Bruce should certainly have found room for some mention of this as making American expansion properly intelligible.

In Mr. Bruce's preface we find the statement: "From beginning to end there is little to regret and much to admire in the story of American expansion." As regards what we have come to possess, we think the country generally is well satisfied to have the gains made within North America securely in our hands; but will the national conscience allow the claim that in making these gains we have done little to regret? In our treatment of the Indians has there been no century of dishonor? or are we ready to accept the comfortable doctrine that the superior race may rightfully sweep away the inferior race, that what we have done has been done on other continents by our forebears from time immemorial, and that for the blackness of darkness we are substituting sweetness and light? It has been confidently asserted that the number of Indians has scarcely diminished since the coming of the whites, that however great their sufferings at the hands of the whites, the tribes inflicted upon each other far greater sufferings; that sparse handfuls of savage humanity, roaming over but by no means occupying a territory, had no rights which civilized newcomers were bound to respect. But can we rest quite easy in this view?

Coming to the acquisition of Louisiana, Mr. Bruce maintains the usual American conception. The central figure in the transaction was, in his opinion, Jefferson, a "nationalistic" statesman in a large sense. He declares it wrong to suppose that Jefferson's "share in the purchase was purely fortuitous, and that in acting as he did he merely pursued a policy of opportunism, founded upon what he perceived to be the will of the people. On the contrary, the Louisiana Purchase meant to him the realization of a long and ardently cherished desire." A more correct view of the acquisition of Louisiana is that it came about through French statesmanship; the initiative was with Napoleon, Jefferson and his negotiators being secondary figures in the transaction. So far from having labored for such an acquisition, no American, except possibly Livingston, had dreamed of it as a thing possible or desirable at that time. "There is nothing to show," says Mr. Bruce, speaking of the offer of Louisiana by Napoleon, "that it had been anticipated and that Monroe and Livingston carried secret instructions authorizing them to accept it." There is nothing to show, he might just as truly have said, that Jefferson or any other man had anything but vague ideas of a national expansion in some remote future and over territory quite undefined; or that Jefferson had at the moment any thought except of the mouth of the Mississippi and the country to the east. As a matter of fact, Jefferson, in his intercourse with the travellers Ledyard, Michaux, and Lewis, before 1803, thought of nothing more than scientific and commercial advantages; and when the news came of what Napoleon had led his envoys into, he was confounded and distressed, feeling that the Constitution sanctioned no such transaction, that a population was about to be turned over to the United States without being consulted, in violation of democratic right, and that, in general, calamity, rather than benefit, would very possibly result from it to the country at large. If ever in American affairs an event has been fortuitous, such was the acquisition of Louisiana; if ever an American statesman has played the rôle of an opportunist, that did Jefferson in 1803. When Thiers, in the "History of the Consulate and the Empire," considers the alienation of Louisiana from France, he remarks: "The United States are indebted for their birth and for their greatness to the long struggle between France and England." We are not concerned here to inquire whether or not the fact that she had France for an enemy made it impossible for England to subdue the Thirteen Colonies. Whoever ponders a book like Charlemagne Tower's "French Alliance" will see reason in the claim that without the French soldiers, fleets, and money, we never could have succeeded. As to the greatness of the United States, however, the doubling of our area by the western half of the Mississippi Valley was a Napoleonic *coup*, by which we profited, but in bringing about which we had no hand. To exalt Jefferson into a prominent place in the affair is, to use an adjective of Mr. Bruce's, a "rashfull" proceeding. Rashfull means, if it means anything, to be full of rash, and the rash we encounter here is an eruption of the American self-sufficiency that refuses to see how far our fate has been shaped on foreign shores, and by statesmen and potentates not of our own blood.

As to subsequent annexations, it is mainly at the expense of Spain, leaving out Hawaii and Alaska, that we have reaped advantage. Are we prepared to accept Mr. Bruce's statement that there is little in our methods which today we need to recall with regret? The claim of Spain to Mexico was based upon the robber expedition of Cortez directed against a people not savage, but which had made some steps toward culture. To Spain had succeeded a nominal republic whose right to inherit vast outlying regions was slender, indeed. Whether or not Texas might fairly be included in the Louisiana Purchase is not easy to decide; and as to the missions and their vague appanages in New Mexico and California, the Mexican right to possession becomes, under cool examination, attenuated to the last degree. We believe that Mr. Bruce might make out a plausible case, though many will feel that America has shown here colossal rapacity. At any rate, few will question that, however secured, it is for the general welfare of the world that Texas, California, and the territory of the Gadsden Purchase are now part of the American Union. Houston and the Austins will probably stand as worthy figures in the American Pantheon. The name of Frémont fell into sad discredit under the tests of the civil war; we should be glad that his earlier career, on which his rise into importance was based, is set forth in this book in the favorable light which it deserves; and we ought not to begrudge to James K. Polk the good word which Mr. Bruce now and then accords him, where the general tone toward him has been that of obloquy.

No one now speaks contemptuously of Alaska, regrets its incorporation, or finds fault with Seward for accomplishing it. The voices that denounce the annexation of Hawaii grow fainter as the years pass, however sore the nation's best conscience may still be over the deed. As to the Philippines, we are still in the thick of embarrassment and controversy. As Louisiana fell to the administration of Jefferson undesired and unlooked for, so the island empire of Spain dropped upon McKinley as a complete surprise. What statesman dreamed that a consequence

of interference in behalf of oppressed Cuba would be this bringing of our white elephant of the Orient into the fold! American expansion has its origin in far antiquity; its surprises are but repetitions of surprises that startled generations in the æons that are mute; there will be surprises in the future, for the venerable disquiet that has impelled the westward movement is still unwasted. Whither? Let us repose in the wisdom of Mr. Dooley: "We don't know, Hinnessy, where we're goin'. But we're on the way."

CURRENT FICTION.

The Third Circle. By Frank Norris. New York: John Lane Co.

However skeptical some of us may have been as to the absolute excellence of the late Frank Norris's young achievement, few can have doubted that he was on the way to excellence. There was a confident ardor about him that seemed almost a guarantee of success. "I am going to make you people sit up," he said to a friend at the very beginning of his career. The friend thought the remark in rather bad taste, but in due time found himself "sitting up." Norris was thinking in trilogies when death cut him off. His precocity was still manifesting itself, he was pushing a little ahead of his powers. "The Pit" and "The Octopus" must stand, after all, as astonishing exercises rather than as portions of an unfinished masterpiece, but there is no mistaking the power in them, or the promise.

The stories here collected are, says Mr. Irwin in his spirited introduction, "the longest and most important of his prentice products. . . . They are an incomparable study in the way a genius takes to find himself." This is putting it strong: the claim is scarcely borne out by the contents of the volume. They seem rather to show how a reporter with a realistic bent may become a writer of brilliant magazine stories. We do not gather that these exhibits are here reprinted in chronological order. As they stand, they display not so much growth as versatility. They are extremely clever, and, with three or four exceptions, patently "magazinable." The list of copyrights printed at the beginning of the book shows in what different markets Norris succeeded in placing his work. But it is the three or four exceptions which to our mind are most individual and striking. Three of them were, we gather from Mr. Irwin, written before the rest, and stand first in the book. The horror of the incident narrated in "The Third Circle" is intensified by the grim and pithy manner of its telling. The writer has no notion of commenting or enlarging upon his facts: it is enough to present them. "The House with the Blinds" and "Little Dramas of the Curbstone" are not properly stories at all, but sketches of certain chance-seen episodes of city life, each of them with its mystery over the solution of which the artist is perfectly non-committal. These vivid bits of romantic realism appeared in the San Francisco *Wave*, when Norris was sub-editor thereof—before the East had heard him and summoned him in its peremptory way to stand and deliver the fruits of his fresh talent.

He succeeded in transplanting that talent without destroying it; but we cannot help thinking that much of the matter in the present volume is reliquian of a temporary surrender, or semi-surrender. It would be interesting to know when the story called "Dying Fires" was written. Here we read of a Californian sub-editor, with a genius for comprehending the life about him, who writes a novel which has life and nature in it. An Eastern publisher accepts it, and the young Californian is presently called to the editorial staff of the publisher's magazine. He comes to New York, and falls in with a set of third-rate "authors," who, with their pretensions and affectations, so confuse, mislead, and altogether bedevil the young fellow that he turns from life to phrases. His second novel is as feeble as it is sophisticated. After a time he realizes his mistake, goes back to the Sierras, and "with such sapped and broken strength as New Bohemia had left him, strove to wrest some wreckage from the dying fire." But the last spark is quenched, and "there remains only a little heap of bitter ashes." Happily, there was no such end of the matter for Norris: his torch burned brighter, and he bore it with steadier hand, to the last.

The Mystery of Miss Motte. By Caroline Atwater Mason. Boston: L. C. Page & Co.

The plan and scope of this little story are rather out of the usual. A girl with a touch of Parsee blood in her veins, figuring as amanuensis to an American clergyman, is not met every day, and is naturally predestined to mystery. Yet after all, the mystery lies more with the nature, acts, and testamentary dispositions of her forebears than with herself, and admits of satisfactory solution in the end. She herself is a nice, spirited girl, Oriental in little else besides her love for India and her susceptibility to the perfume of jasmine. In surveying the thickly peopled scene of the story, the reader is aware, a little uncomfortably, of the author's determination to make original characters at all hazards. The two really noteworthy figures are those of the clergymen, the rector and his curate; the religious epicure and the mystic; the man who is in a large sense a religion "promoter," sincere but cynical, and his junior, to whom religion is still "a reality, a passion, a life." The two are thoroughly alive as men and as representatives of contrasted currents of thought, which at the last bid fair to unite in one clarified stream. That both men are in love with the mysterious Miss Motte gives human zest to their spiritual contests, and affords a chance for one of them to turn defeat into moral victory.

The Bronze Bell. By Louis Joseph Vance. New York: Dodd, Mead & Co.

There are stories which one reads with full consciousness of how silly they are, but with the determination to see the absurd thing through. So far as the author is concerned, that is, undoubtedly, quite satisfactory. Mr. Vance's latest yarn harks back to the early Rider Haggard. A mysterious dark-faced gentleman, on a lonely sandbar off the south shore of Long Island, is sought out by creepy Babu messengers, who present him with the traditional token of a huge emerald in whose depths flash baleful shafts of light, etc. From Long Island we move on to Calcutta and Rajputana, and straight into the heart of dark bazaars, Indian palaces inhabited by wondrously beautiful, olive-skinned fiends in woman's form, subterranean water-passages, cobras, gates of swords, and mystic oaths. The hero and the heroine are, of course, Anglo-Saxon. Through the direst adventures, they keep immaculate the beautiful clothes in which Mr. Harrison Fisher has set off their magnificent physique. Persons of mature years will sit up to read Mr. Vance's story and prove how the heart of man never grows old.

Oh! Christina! By J. J. Bell. New York: Fleming H. Revell Co.

The publishers confidently blazon forth this little story as "the laughing hit of the year." We suppose such a claim would have to be substantiated on a basis of number of copies sold, and we should say that unless the author of "Mrs. Wiggs of the Cabbage-Patch" exerts herself to some purpose, the prophecy may very likely come true. Christina is a feminine version of "Wee Macgreegor," with the precocious wit and the uncanny canniness of the Glasgow street arab. After a harum-scarum childhood, fate or her creator puts her in charge (the phrase may be left ambiguous) of a maiden aunt who keeps a toy-shop in the village of "Kilmabeg." The contrast in age, training, and temperament between these two furnishes the fun. It is good fun, and has the advantage of being obvious enough for that child-like audience, the Best-Buying public.

Miss Purvis, the aunt, is like the serious and literal-minded interlocutor who sets off the rollicking humorist of a double turn in vaudeville. Her lines are restricted chiefly to "Really,

Christina!" and "You are a very strange girl." She is three times as much surprised and shocked at everything Christina says or does as the audience can possibly be expected to be. But, in a way, she is necessary. Her simplicity gives the cue, keeps the ball of Christina's impishness busily rolling. Christina and her nonsense are likely to be much laughed at and quickly forgotten, which is, of course, laying more to her credit than to her discredit.

An Anarchist Woman. By Hutchins Hapgood. New York: Duffield & Co. $1.25.

This is a book belonging to the same general order as Mr. Hapgood's "Autobiography of a Thief" and "The Spirit of Labor." It is a report of "low" life tinged with almost morbid sympathy. Mr. Hapgood is a Defoe who adores his Colonel Jack and his Moll Flanders. The very fact that other people are not likely to adore them, are even likely to find them contemptible objects, prepossesses him strongly in their favor. "When we are more accustomed to social thought," he says, "we shall not regard those who radically differ from us, as mad dogs or malevolent idiots." Per contra, we shall perceive that mad dogs and malevolent idiots are merely beings who differ from us, and probably for the better.

Mr. Hapgood's chief fault is lack of humor, and the effect of it in this instance is rather appalling. He is undertaking to study "the natural history of the anarchist" and chooses two persons as his exemplars. One is a woman who, when he met her at twenty-three, "had more completely translated her life into terms of thought than any other woman of my acquaintance." She had led a most dissolute life, in which drink and promiscuous relations with men played the chief parts. Then she met Terry, in the eyes of the world a drunken loafer, but really "a perfect type of the idealist. We shall see," promises the chronicler, "how in the midst of what the world calls immorality and sordidness, this quality in him was ever present." Marie becomes his mistress on terms which bind her to nothing; in fact, she maintains the utmost liberty of morals, and at one time deliberately takes to the street. But this is where Terry's idealism comes in: he considers prostitution better than marriage, and infinitely better than work. After a time she comes back to him. They are a cheerful pair. Mr. Hapgood's story is largely made up of letters to him, from one or the other of these two. They are extremely frank letters, but they have little beside frankness to recommend them. By her own testimony, the girl gives full play to her natural instinct for gross dissipation, and it is too evident that the man is a drunken loafer who worships his own image. He has the Irish fondness for eloquence, and is always spreading the eagle:

> To exchange the rack-rented but limitless fields of Irish landlordism for the rickety and equally rack-rented tenements, with the checkerboard streets, where all must keep moving, is only adding sordidness to spare sadness.

This is the kind of thing Mr. Hapgood calls "poetic." Terry, who is a good mechanic, thinks it a disgrace to work, but he is quite willing to live at the expense of hard-working friends, and once takes a job as barkeeper with a clear conscience on the ground that it is more graft than work, since the carelessness of his employer makes it easy for him to steal a large part of the takings. Under the tutelage of this moralist and thinker, Marie begins to develop her own profound intellectual powers. If it were not for a growing habit of throwing things at each other, they might still be helping each other onward and upward. But they are no longer together. Marie has lapsed into virtue and housework, and Terry, with the aid of cigarettes, whiskey, hashish, and despair of regenerating mankind, is near his logical end. We have no reason to doubt that these are real persons, but it is hard to understand Mr. Hapgood.

A Sister of Prince Rupert. Elizabeth Princess Palatine and Abbess of Herford. By Elizabeth Godfrey. New York: John Lane Co. $4 net.

Sometimes there meets us in the pages of history a personality that appeals to us, not by splendor or achievement, not by political importance, but in virtue of an intimate and familiar charm, or by some strange potency of self-revelation whereby we know him in his tastes and his idiosyncrasies as we know those we meet in everyday life, not as we image from afar the occupants of thrones or the dwellers in the distant arena of statecraft.

We quote the opening sentence of this book for a double purpose. It is, in the first place, a specimen of the untrained, if not execrable, taste into which the writers of biography seem to be yearly sinking deeper and deeper. The present biographer, as a matter of fact, writes for the most part in a simple, if not very refined, style, yet from sheer lack of literary discipline she can begin her work with a sentence that would bring a blush to a self-respecting sophomore. The lamentable fact is that the great mass of popular biographies turned out by the presses—and the *genre* is one of peculiar difficulties—are written by amateur penmen who have not acquired the first principles of composition. So much to relieve the spleen of a reviewer who reads biographical works by choice and is too often deceived in his expectations of pleasure.

The sentence is quoted also because, despite its foolish exaggeration, it indicates the real interest of the pages that follow. There was no "strange potency of self-revelation" about the Princess Elizabeth, but she was a charming, piquant person, and a writer of letters that admit us to formal acquaintance at least with an extraordinary circle of people. As the child of King James's ill-fated daughter, who, as Howell relates, was "called the Queen of Bohemia, and for her winning, princely comportment, the Queen of Hearts," she was born to a place in romance. The effort to reconstruct the child's life at the great palace of Heidelberg, where she was born, and during the disastrous expedition of her father into Bohemia, is a little too apparent. Our real knowledge of her begins with the school days at Leyden, and is taken from the Memoirs of her sister Sophie, afterward mother of George I, and from the correspondence among the members of the large family. Even here the reader is perhaps fretted at times by the effort to realize the child's state of mind from insufficient material. For these conjectures we should prefer to have fuller extracts from the letters that passed between Elizabeth and Descartes at The Hague, and a more ample account of the philosophy which played so important a part in the princess's life, and which, in its ethical aspects, was so largely developed under her influence. The chapter entitled "The Consolations of Philosophy" is fairly well written: the passages from the letters are wisely selected and agreeably translated; they fail only in being too few. "I have always," writes Elizabeth to her Mentor, "been in a condition which renders my life very useless to those whom I love, but I seek to preserve it with far more ease since I have had the happiness of knowing you, because you have shown me the means of living far more happily than I had done before." That lesson of philosophic calm is one of the oases in history, and we should love to linger over it, even if the journey through the rest of the princess's life, with her restored brother at Heidelberg, and as abbess at the Protestant nunnery of Herford, were proportionately hastened.

It cannot be denied that this biography has many of the crudities that mark this kind of writing to-day, but it is based on good knowledge of the sources, is, in general, despite its lapses, simply written, and has to its great advantage a thoroughly entertaining subject which is not much known to the ordinary English reader.

The Imperial Gazetteer of India. Vols. XXV-XXVI, Index, Atlas. New Edition. Published under the authority of His Majesty's Secretary of State for India in Council. New York: Henry Frowde.

The two concluding volumes of the

new edition of the Gazetteer, just published, fully maintain the unique excellence of this monumental work. The Index, Vol. XXV, is not merely a list of references, but is a carefully prepared digest of the facts contained in the Gazetteer, and is accordingly of inestimable value to the student of any Indian subject. Under cotton, for instance, will be found, first, references to general statements as to its production, then alphabetical lists of places where it is cultivated and where there are ginning and pressing factories, followed by references to the manufacture from earliest times and to the location of two hundred and more mills. To the historical and biographical references dates are frequently added. It is interesting to note that the largest space is devoted to the enumeration of the places containing noted temples, and the next largest to the stations of the sixty-five Protestant missions, the American alone occupying nearly half of the five pages given to them. Of course, in a work of this magnitude omissions are inevitable, but we are surprised that we can find no mention of the famous Guides of the Indian army, especially when there is a reference to the nurse of Shah Jahan. The Atlas, Vol. XXVI, which can be purchased separately, contains sixty-four excellent maps, nearly half of which are general, showing among other things the surface features, density of population, the distribution of the different races, languages, and religions, the various products, military and political divisions, and railways. In addition to maps of the provinces, there are plans of thirteen cities.

The only error we have detected is that Bostan, a town near Quetta, is printed on map 47 Boston. It is correctly spelled on map 35 and in the index.

Science.

The Earth's Bounty. By Kate V. St. Maur. New York: The Macmillan Co. $1.75 net.

This is a practical book, a reminder (and one is occasionally needed) that women can write upon plants and animals without dissolving in sentiment. If Mrs. St. Maur's first book, "A Self-Supporting Home," sent, as has been asserted, more families to the country than any other book except "The Fat of the Land," then "The Earth's Bounty" should break the record of that amusing bit of fiction. For Mrs. St Maur shows that, even without the apparently unlimited capital of the gentleman who lived on the fat of his acres, it is possible to thrive upon a farm.

The book is a supplement to "A Self-Supporting Home," but except for a final "itinerary" of the year's work, the plan is different and better. In successive chapters Mrs. St. Maur takes up various farm topics, and treats each one thoroughly. The subjects come somewhat at haphazard—one would expect, perhaps, the chapters to be in groups covering animals, birds, and farming proper—but in this case the order is doubtless the natural one, as Mrs. St. Maur confesses that the various departments of her industry were frequently begun as the result of an accident. Her fortune led her to ventures as widely different as angora goats and apples, silos and toy dogs, but whether she is managing a violet house or making a manure pit her processes and conclusions seem sensible, and her profit reasonable. She reports no failures.

Her fondness for animals led her into adopting household pets, which afterward proved the nucleus of a flock, a herd, or a stud. From Rachel, bought "because without a cow a country home is incomplete," came a steady trade in butter. From a driving-mare, bought because she was cheap, and the temptation great, rose the beginnings of a small but good business in colts. Common goats, acquired for the purpose of clearing brush, led to a mixed trade in milk and cheese, and finally to a flock of angoras which, besides being efficient in sprout-land, produced saleable kids and the best mohair. Finally when Jack, wounded and half-strangled, hurled himself through a window and across Mrs. Maur's knees in the middle of a thunder storm, her dog kennel was begun. We shall expect, in her next book, to hear of her trade in squirrels and opossums. Hens appear to be with her a deliberate choice, but quail and wild duck she keeps because she cannot hold her hand from something new.

The lover of pets is not always the lover of inanimate nature, but Mrs. St. Maur seems almost to make pets of her trees, and it would not be difficult to imagine her sitting up nights with her violets. With both she has been successful. And when she reaches the subjects of rotations, silage, and manures, though denied the possibility of sympathy with her subject, she nevertheless manages to find the important problems, and to present them for examination.

It is doubtless possible to find fault with Mrs. St. Maur's facts, or with her advice. The Massachusetts farmer, for instance, will marvel greatly at her advice for asparagus, and will inquire if she has never heard of deep setting of one-year roots in loam of ordinary depth. She advises the shallow planting of seed, or the setting of two-year roots, in deeply prepared earth. Her methods here seem to be truly old-fashioned and foreign; few farmers in America can afford, even for the home garden, trenches or the hand-labor of cultivating shallow-set plants. Tested similarly, some few other of her recommendations may fail. But in general she is up-to-date, and the spirit of her book is modern, in that she is experimental. She is, besides, practical. At times her style savors of a farmer's bulletin; in fact, she quotes largely from experiment-station reports, often without quotation marks, so that it is sometimes a problem whether she is speaking or some one else.

Without pretending to a literary style, Mrs. St. Maur is able to get at the gist of the matter in hand, and to state it clearly. The farmer, as well as the man or woman who hopes for profit in pets, can gain much from this book.

T. Mellard Reade, a distinguished architect and surveyor of Liverpool, has died, at the age of seventy-seven. Mr. Reade was interested in physical geology and wrote several books on the subject, including "The Origin of Mountain Ranges," "The Evolution of Earth-Structure," and "Chemical Denudation in Relation to Geological Time."

From Berlin comes the report of the death, at the age of sixty-six, of Dr. Adolf Pinner, professor of chemistry in the University of that place. He wrote on both organic and inorganic chemistry. Among his books are "Lehrbuch der organischen Chemie," "Lehrbuch der anorganischen Chemie," and "Gesetze der Naturerscheinungen."

Drama.

THE BACON ACROSTIC.

Some Acrostic Signatures of Francis Bacon. By W. S. Booth. Boston: Houghton Mifflin Co.

Mr. Booth's book has already made its converts, so painstaking, ingenious, and beguiling is it. He does not attempt in any sense to treat the whole Baconian theory, accepting, rather, most of the conclusions and evidence of Greenwood and Begley. He divides his royal octavo volume of some six hundred and twenty pages into two parts. The first part, after some preliminary treatment of Elizabethan cryptography, considers "The Uses of Ciphers," "Anonymity and Pseudonymity," "Method," and "Practical Specimens of Acrostical Signatures." In Part Two, in some fifteen chapters, he deciphers the signatures of Francis and Anthony Bacon in works originally published anonymously, or over the names of other men. Here he treats, with facsimile pages or titles from quartos and folios, the appearance of a Bacon cipher in poems and plays of Shakespeare, in "Tamburlaine," the "Jew of Malta," some poems which have usually been assigned to Edmund Spenser, and in other material which he believes needs reassignment on the basis of his cipher. The Appendix concerns itself with "Further Remarks on False Names and Pen Names," "The Use of Acrostics in Ancient

Times," "The Spelling of Francis Bacon's Names and Titles," and "Some Books on Ciphering and Deciphering."

This is the most thorough discussion we have yet had of concealed signatures in the work usually assigned to Shakespeare. Nevertheless, the argument breaks down; first, as to method, and, secondly, when tested by the printing customs of the Elizabethan age, by common human experience, and by facts in the history of the Elizabethan drama. There are grave dangers in Mr. Booth's logical method, both general and special. He is too fond of statements like the following:

> In each case [of the ciphers or acrostics which he has discovered] the acrostic is of secondary importance, and was put into the composition after it was written, and, so far as we can judge, for the purposes of identification, or for a personal satisfaction. Thus the writing was done free from all restraint, and with little thought of the name which was to be inserted, after its completion, or when it came to be printed (p. 43).

The words "In each case" and the final sentence absolutely beg the question, for Mr. Booth adduces no proof to show that the acrostic came or must come from reworking. Even if he retort that it makes little difference to him whether the acrostic was introduced into the original writing or later, this is not properly cautious statement for one who is trying to lay a logical foundation for a complicated theory of supposed large significance. When Mr. Booth adds (p. 44), "There is no need to suppose the poet himself inserted all the signatures. Any one of several competent servants could have done it for him," he enters upon three-fold assertion, for we need to know that there was reason for Bacon to wish to insert a cipher; that "servants" would be competent; and thirdly, that Bacon was likely to let them do such work for him. Mr. Booth believes so firmly in his conclusions that more than once he lays down premises which beg the entire question.

Again, when Mr. Booth in the chapter on Method gives the rules of the game we are to play with him, one is impressed by the extreme freedom he allows himself. He states some rule, only to admit in text, or footnote, or practice later, that he permits himself exceptions when necessary. For instance, he makes much of starting from the first right hand or left hand word in a poem, if it begin or end with B or N or O, and of landing on a similarly placed word in the last line, distinguished initially by one of these letters. Yet he allows himself great freedom in starting from words or letters in headings, signatures, or words in the second or the next to last line. Moreover, when he asserts that "for acrostic purposes, the abbreviated names of characters are not used in the acrostic spelling, except in certain very few well defined instances, to which I have called attention in their places" (p. 42), and, "for acrostic purposes, the stage directions are not used," adding in a footnote "with the few exceptions noted in their places," he leaves a reader wondering how he is to distinguish exceptions. Just here Mr. Booth's theories break down. He shows clearly enough that two kinds of cipher were common: first, those intended to display the ingenuity of the writer, such as the spelling of the name "Volpone" by the initial letters of the Argument prefixed to that play (p. 77); secondly, carefully concealed ciphers used as a means of communication between two persons holding a key. He then asks that we should believe a cipher was carefully concealed in the so-called Shakespeare plays, and other manuscripts and printed matter, by Bacon and his friends, when the people for whom the message was meant held no key, and the method could be discovered only after three centuries. Moreover, what is characteristic of nearly all the ciphers illustrated by him, except his own, is their simplicity and regularity. They follow the initial or final letters of each line; they are formed on the letters running from the first of the first line to perhaps the fifteenth of the last line; or they take the initial letter of every other word, etc. In his own cipher, Mr. Booth in the first place allows himself great freedom in his spelling of Bacon's name; it may read Francis Bacon, Fran Bacon, Franciscus Bacon with one or two f's, Francisco Bacono, and in many other combinations; and one may read either both names backward, or one name forward and the other backward, etc., etc. Though his favorite method is to start with the initial word in the first or last line, and work backward or forward moving from right to left in an orderly sequence, by initial letters or as if the words were strung on a string, yet he allows himself great freedom both as to his point of beginning, and his method of search. Now he uses only initial letters; now he uses all the letters; now he goes but once round a set of verses, and again he makes a second journey. The fact is, that when one takes a group of such common letters as occur in the name of Francis Bacon, and searches with great freedom of movement in a page of manuscript or text, allowing one's self much liberty in spelling the name in question, it is more difficult not to find acrostics than to find them. This is proved true by the acrostics of all kinds discovered, since the appearance of Mr. Booth's book, by eager contributors to the press. The very latitude on which Mr. Booth prides himself in his acrostic system seems likely to be its ruin. Probably it will soon be shown by this cipher that Bacon set his mark on most of our literature.

In another respect the book is oddly unsatisfactory. On page 42 Mr. Booth quotes two lines from "Antony and Cleopatra" and comments thus:

> *Ant.* Favours? By Ioue that thunders. What art thou *Thid.* One that but performes. (Fellow?
>
> Tho word which is carried over belongs to the line on which it stands typographically; and in reading for the acrostic it must be read with that line.

Now, the acrostics were inserted either in the original manuscript or in proof. If they were inserted in the manuscript, this regulation just quoted would again and again have rendered them null. Any one who has collated Elizabethan or Jacobean plays knows that nothing is more erratic than the division of the lines. Not only is verse set as prose, and prose as verse, but in successive editions the lines will be spaced so differently that, in each, different words, or groups of words, will be dropped below the line. No author could possibly foresee just where this would happen, yet when his lines were broken up by the printer, the cipher would, by the ruling of Mr. Booth, inevitably disappear.

But let us look for a moment at this whole question of inserting ciphers in manuscript plays. A play was sold to a dramatic company. Very often it never came to publication, and the author had no reason to suppose it would come. In other words, it was not at all sure the play would ever be printed, or would ever go beyond the hands of the company. Why, then, trouble about a cipher, especially one which is so free in its movement that it has been overlooked for some three hundred years? Again, why trouble with a cipher, unless one place it on almost every page, when the mere vagaries of the printer may completely destroy that cipher? We have evidence enough that surreptitious and unauthorized publication of plays was exceedingly common. Nor have we good proof, except in rare cases like Ben Jonson's, that the dramatists supervised the printing of their plays. We have direct proof to the contrary in some cases. Indeed, surreptitious publications involved another chance of error. Plays were often taken down in the theatre by hacks sent by the publishers. This is held by some students to be in part the history of the First Quarto "Hamlet." The copious errors such a process might produce would play havoc with a cipher. Indeed, when dealing with the two quartos of "Hamlet," Mr. Booth is forced, because the cipher in the first has disappeared in the second, to find a new cipher in Q2, and to argue that Bacon or some "servant" inserted it when the second quarto was going through the press. But there is another chance that a printer might destroy a cipher, or several ciphers. The present reviewer has seen, among five differing issues of

the same edition of a play of Barnabe Barnes, one in which parts were more correct than the other issues, yet other parts were as corrupt as the worst. In this the printer corrected or not as he pleased, or the binder picked up at random corrected and uncorrected sheets. In such copies, containing both errors in plenty and unauthorized corrections, what would become of ciphers which the author desired to be inserted by "servants" in the proof?

Is it in accord with ordinary human experience that these ciphers were inserted by "servants"? Does Mr. Booth show that it is wholly easy in dramatic composition to substitute one word for another and yet keep the full desired effect? Does he believe that "servants" —a word badly in need of definition as used in this book—would be competent for such skilful editing? Is the dramatist or author usually complacent under such tampering with his MSS.? A theory must conform to the usual and probable in human conduct, and this theory strains one's accepted idea of one's fellows.

For Mr. Booth it is enough to illustrate his findings in cipher and to state his conclusions. He does not often consider to what extent his cipher is offset by the body of known or supposed fact in regard to authors, plays, or poems considered. When, for instance, he asks us, on the basis of the cipher, to accept "Tamburlaine" and the "Jew of Malta" as Bacon's, a student of the Elizabethan drama revolts. Surely Marlowe's mighty line, general spirit, and individual technical methods are recognizable, and should more than offset finding by this freely moving system Bacon's name in some title page or series of lines. If we grant that Bacon was Marlowe, that Bacon was Shakespeare, and that Bacon was also the Bacon of the "Essays" and scientific work, what refuge is there for us, facing these three distinct personalities, except in Dr. Morton Prince and his theories of the multiple personality!

The purpose of the book is serious, its method is painstaking, and it aims to be judicial, but can a theory which proves too much, and which calls for belief in an extraordinary manifestation of multiple personality, be taken with entire seriousness?

Jacob Gordin, the Yiddish playwright, died in Brooklyn, June 11, after a long illness. He was born in 1853, at Mivgorod, Poltava, Russia. He came to this country in 1891, and until then had never written a play. His first drama, "Siberia," composed for Jacob P. Adler in 1892, met with no success; but by perseverance and talent he succeeded in making himself a power in the East Side, and in raising the Yiddish theatre to honor. His strongest play, "God, Man, and the Devil," modelled on the Faust idea, has been translated into classic German and performed in Europe.

Music.

Grieg and His Music. By Henry T. Finck. New York: John Lane Co. $2.50.

No reader of this journal needs to be told that Mr. Finck is a fervent admirer of Edvard Grieg, or that, as a critic, he has the courage of his opinions. This book—an amplification of a former volume which appeared in the series of Living Masters of Music—is practically a new work, and may be briefly described as an enthusiastic appreciation of the Norwegian Master, as composer, executant, conductor, and man. To musicians it will be welcome and valuable on account of its comprehensive analytical studies of different phases of Grieg's genius, while the general reader will find much to interest him in the biographcal and descriptive passages, which are uncommonly rich in personal anecdote, in the observation possible only to intimate friendship, and to the revelations of private correspondence. Mr. Finck has been particularly fortunate in being able to quote the letters of the composer to Dr. Röntgen and Mr. Frants Beyer. By means of these, and other similar documents, he projects a vital image of his subject, and his work will take its place at once as a standard authority.

Remotely, Grieg was of Scottish ancestry on the paternal side, but, practically, the Scandinavian blood in his veins was free from foreign taint. To all intents and purposes he was a product of that Norseland of whose spirit and characteristics he was to become so inspired an interpreter. One of the commonest of the charges preferred against him by his critical detractors is that he was an imitator, that he borrowed his melodies chiefly from the Norwegian folk-songs, with which he was necessarily familiar. As a matter of fact, his borrowings from this source were so rare as to be wholly insignificant, compared with the bulk of his original output. Moreover, he took nothing that he did not transform and glorify. He himself is authority for the statement that of all his songs only one, "Solvejg's Lied," is based on a theme not of his own creation. Of the fertility of his invention the proof is abundant and indisputable. On no point is Mr. Finck more emphatic than he is in defending Grieg from the accusation of plagiarism, and his position may be pronounced impregnable. So strenuous a defence, perhaps, was scarcely necessary. Genius has always assumed, and is generally allowed, the right of appropriating what material it chooses, but only on condition of improving it.

The genius of Grieg, coming to him by legitimate inheritance, manifested itself almost from infancy, and was developed in an ideally congenial atmosphere. His mother, a great pianist, a worshipper of Beethoven, Mozart, and Weber, and an appreciative student of Chopin, was also a conscientious teacher, and applied the needed stimulus to her imaginative lad, who often preferred indolent dreaming to the rigors of practice. It was Ole Bull who first recognized the latent power in his boyish improvisations and persuaded his parents to send him to Leipzig. There, too, in the beginning, he exhibited the waywardness of a soul conscious of inspiration but uncertain of its tendency. Rigid courses of instruction were irksome to him, and he found his chief happiness in abandoning himself to flights of musical fancy. But when he once perceived the necessity of discipline, he worked so assiduously that he suffered nervous and physical collapse. An attack of pleurisy followed, which left him but one serviceable lung, and doomed him to lifelong delicacy. Nevertheless, in his final examinations, he won honors both as a composer and as an instrumentalist.

In the critical days that followed, Ole Bull and the short-lived Rikard Nordraak gave him invaluable encouragement to follow the bent of his individual genius and to break through the shackles of classical tradition. Thus it came about that the Euterpe Society was founded for the production of works of young northern composers, and that, as long ago as 1866, he was able to give a concert in Christiania, with a programme of Norwegian music only, Nordraak, Kjerulf, and himself being the composers. The success of the experiment exceeded all expectation, and from that time on his star was in the ascendant.

By 1874 his fame and popularity had so increased that the government awarded him a pension, upon which he retired to Bergen to work upon the "Peer Gynt" music, by which he is, perhaps, best known to the world at large. He undertook the task at the suggestion of Ibsen himself, and his success in accomplishing it is all the more remarkable, when the embarrassing theatrical conditions imposed upon him are taken into consideration. It is not necessary to discuss here the extraordinary felicity of this achievement upon which Mr. Finck enlarges with characteristic fervor, but we may point out that it has done more to popularize the name of Ibsen than the play itself. That it has been largely instrumental also in spreading abroad the fame of Grieg, and in attracting public attention to his other works, is unquestionable. Thirty years ago his reputation as composer, conductor, and pianist had been firmly established in all musical centres, and since then his popularity has been growing steadily over all the civilized world. His orchestral and chamber music, his piano pieces, and his songs, in

which his genius often finds its most characteristic national expression, have extorted the enthusiastic admiration of the most eminent connoisseurs. Mr. Finck, after an elaborate survey of all his works, vocal and instrumental, assigns him unhesitatingly to the first "rank of composers, on the ground that none of the great masters has contributed more unique and charming melodic, harmonic, and rhythmic ideas in the same number of pages, and none has succeeded better in expressing his thoughts in the most fitting manner."

Much space in this substantial volume is devoted to Grieg's personality—in which mental vigor and physical weakness were in perpetual conflict—to his manner of work, his characteristics as a pianist and conductor, his domestic habits, and his artistic views. The book is a full and satisfying one, whether considered in its critical or biographical aspect, and certainly does full justice to its subject.

Art.

The Acropolis of Athens. By Martin L d'Ooge. New York: The Macmillan Company.

A history of the Athenian Acropolis from the earliest historic period down to our times presents many difficulties to the conscientious writer who proposes to deal with the subject at all adequately. The importance of the various buildings gathered on the Acropolis, their chequered career, and above all the conflicting theories regarding them held by modern archæologists, make a clear exposition not an easy matter. A successful handling of the material, as given in Professor d'Ooge's volume, is therefore the more to be appreciated, especially since a book of the kind has been much in request, not only by the archæological student, but by every intelligent visitor to Athens. "Ancient Athens," by E. A. Gardner, "Mythology and Monuments of Ancient Athens," by Jane E. Harrison, and J. G. Frazer's "Pausanias," Vol. II, are the English books which have somewhat supplied the need hitherto. But the last two deal with the subject from a specific aspect, as their titles imply, and the first is only a handbook which does not profess to treat exhaustively any of the problems involved. Professor d'Ooge's book, on the other hand, takes up the subject systematically, views it from its varied aspects, historical, religious, and artistic, and patiently sets forth all the information we possess concerning it—material that has been gathered from many books and articles. Moreover, the whole presents a readable, though perhaps rather matter-of-fact, account. In a work of this sort, we do not expect much original matter. Professor d'Ooge, though he has studied both the actual monuments and their literature carefully, is not one of the investigators whose discoveries make up our present knowledge. At the same time, he does not blindly follow any one authority, but gives a clear, dispassionate statement of the case, criticising the weak points in various theories and then selecting the most probable solution of the question in hand. It is in this open-mindedness and wide acquaintance of the subject that the chief value of the book lies.

The material comprises not only the buildings on the summit of the Acropolis, but all the ruins discovered on its slopes, such as the various caves, the Pelargicon, the Asclepieum, the sanctuary and theatre of Dionysus, etc., as well as the more important sculptural works that have come to light during the excavations on these sites. The order adopted is mainly but not entirely historical; for instance, to avoid confusion, the buildings on the southern slope are dealt with consecutively in one chapter. The appendix on the Pelargicon and that on the old temple of Athena, which gives a full account of the widely divergent views held on this subject, will be welcomed by every student.

Such a consecutive history of the Acropolis cannot fail to impress us with the varied changes which have befallen the site, and the manner in which fate again and again brought about, first the circumstances which created the splendor of its buildings and then the catastrophes which destroyed them. But, though the hill has suffered many visitations, it has, at least, been spared that of the incompetent excavator. During the systematic excavations carried on between 1885 and 1889, the whole surface of the Acropolis was carefully dug up down to the bedrock, and every inch of soil was turned over and examined, so that the minutest fragment was not allowed to escape. The result is that all the data attainable have been brought safely into our possession, to be illumined by such investigators as Dörpfeld, Furtwängler, Wiegand, and others. Indeed, the patient "detective" work of discovering clues, of building up a chain of evidence, and thus reconstructing the monuments of the past has rarely been done so brilliantly and so successfully as on the Acropolis hill. To the importance of this detailed work Professor d'Ooge gives due prominence.

The least successful part of the book is that which deals with the sculptural remains. It does not show the same careful study, the information being clearly taken from general books. Thus, in many instances, the author is content to quote freely from Gardner's "Handbook of Greek Sculpture." This lack of first-hand knowledge comes out in some curious mistakes, such as assigning the originals of the Naples group of tyrannicides to Antenor instead of Kritios and Nesiotes, in whose favor the discovery of the dated vase fragment representing the group (now in the Museum of Fine Arts, Boston) has finally decided the question of authorship.

There is a very rich series of illustrations consisting both of plates and cuts in the text. Their selection and variety show that the author has spared no pains to add to the clearness of his text. His system, however, of putting notes and references at the end of the volume, instead of at the foot of each page, is cumbrous.

The *Burlington Magazine* for May is a number of unusually varied contents, containing several articles which should attract a wider circle of readers than that habitually appealed to by this publication. The first of these is on the newly discovered David with the Head of Goliath by Rembrandt, by no means a great picture, but very interesting as being, apparently, the earliest of that master's compositions of many figures. The date, as now read, is 1627, the year of the Money Changer of Berlin and the St. Paul of Stuttgart, hitherto the earliest known paintings by Rembrandt, each of which represents a single figure only. Another recent discovery, the Settala Leonardo, is disposed of in an illustrated article which reproduces three of the ten variants known to exist of this Leonardesque motive—a nude Gioconda—of which the presumable original is a cartoon at Chantilly. The new discovery is quite the poorest of the three, and the flowery background is unmistakably Flemish. The note of contemporaneity is struck by Prof. C. J. Holmes in an article on "Two Modern Pictures," in which he calls attention to the element of personality subtly pervading a good landscape by Harpignies and rather aggressively announced in A. E. John's Woman Smiling. Americans will be especially interested in Kenyon Cox's attempt to characterize the work of that admirable artist J. Alden Weir, and in the editorial "Thoughts on the American Tariff." The editor considers the retention of a duty on works of art less than twenty years old as "a sop to American painters," and gravely assures these gentlemen that they are making a mistake because American collectors will, in any case, only buy pictures by artists of great reputation, which they will buy, duty or no duty, the payment of the duty rather serving to keep such pictures in America, "since they cannot be re-exported without loss until the twenty-year limit is passed." Therefore our painters will "escape general competition only at the cost of having to face competition with the picked work of Europe." All this may be true, but it entirely fails in comprehension of the attitude of American artists. Our best artists are not seeking to avoid competition, and are not in favor of the twenty-year limitation. All they ask is a fair field and no favor, and the doing away with the presumption in favor of imported work, because of the duty paid upon it. If foreign work is good, they wish to learn from it; if it is bad, they wish the

public to learn how bad it is. They are profoundly convinced that the more good pictures people buy the more they will want, and, as they intend to go on producing good pictures themselves, they would willingly see Europe despoiled in our favor of the best contemporary work as it is already being despoiled of the old.

The excavations at Sparta, carried on by the director and students of the British School of Archæology in Athens, have again yielded important results. In excavating the "Menelaon," the reputed tomb of Menelaos and Helen, there have been found remains of the Mycenæan age, such as bricks coated with plaster, on which in some cases are traces of fresco painting, and fragments of Mycenæan pottery of a local type, which were unearthed both below the monument and in an adjoining building. Similar remains were found near by. The importance of these discoveries lies in the fact that they are the first Mycenæan remnants that have come to light in Sparta and it is possible that the site may prove to be that of the Mycenæan Sparta. The monument called the Menelaon, which is built of large conglomerate blocks, appears to date from the fifth century B. C. At the foot of a slope, a little below it, a number of bronze and lead votive offerings, apparently of the seventh century, have been found, including beads, axes, fibulæ, and plaques, as well as a large number of terra-cottas, some of exceptional workmanship. The pottery found in the immediate neighborhood of the monument ranges from Mycenæan in the lowest stratum to about 400 B. C. The complete excavation of the whole site will be reserved for next year.

The results of other excavations in Greek lands this season are also now coming in. In digging at Triphylia, near the village of Kakovatos, domed tombs were discovered of the Mycenæan age, unfortunately quite ruined and despoiled except for the foundations and some objects which help to certify their early date. The excavations at Pergamos, carried on by the German school for the last thirty years, have been chiefly concentrated on the large gymnasium and the neighboring area. This gymnasium is shown to have been the largest building of the kind so far known to us from antiquity. To the east of it baths have been unearthed comprising eight rooms; to the west a temple which was apparently originally of the Doric style, but was afterwards converted into Ionic; above on a terrace were discovered two sanctuaries, one dedicated to Hera, the other to Demeter.

Finance.

LENDING TO CHINA.

According to London dispatches and interviews with our own State Department, our foreign legations have insisted that an American syndicate be allowed to participate in a $27,500,000 loan to the so-called Hankow-Sze-Chuen Railway in China. As stated in these advices, the Chinese government, as far back as 1904, had expressed to our Minister at Peking its willingness that, in case the contemplated enterprise could not be financed with Chinese capital, American capital should participate. A few days ago, certain English, German, and French banking houses signed an agreement for a "tripartite participation" in the loan; the present diplomatic demonstration appears to amount to a demand for the right of American participation.

There are several points of view from which this incident may be regarded. The first is clearly political. The much-worn maxim that "trade follows the flag" has of recent years given place to another maxim, whose truth has as yet been imperfectly tested, that "trade follows the lending of money." In one sense, the second maxim is confirmed by experience. Certainly, England's export of merchandise to new foreign fields has in the past gone hand in hand with its exports in the form of capital for investment in the same fields. Not to mention the British colonies, the case of Argentina and Egypt is much in point. But in these admitted instances, there was some doubt whether export trade or investment capital went first. The familiar English plan of building up trade in a foreign locality, sending out younger sons of a mercantile house to represent on the spot the home establishment, and thus establishing a British colony at Buenos Ayres or Alexandria, would of itself lead to, rather than follow in, the path of investment in railway and industrial enterprises.

This is not the consideration on which the more modern reasoning is based. During the fifteen years or so in which the so-called "colonial expansion movement" has been active among all the European Powers, two other principles seem to have been the basis of action of investment markets—one, that the good-will of a foreign state could be surely gained by providing funds for its public or private enterprises; the other, that existence of such investments in a country like Egypt or China would give a certain right to political intervention by the government whose markets put up the necessary funds.

It is in China that this mingling of diplomacy and finance has from the first assumed the most extraordinary form. Disastrously beaten by Japan in the war of 1894, and with most of its public revenues already pledged as security for earlier loans, the Chinese government had to face the problem of paying a war indemnity of 200,000,000 taels, or, roughly, $130,000,000. One might have pictured unfortunate China going, hat in hand, to the various market-places to negotiate a loan. Not at all. A scramble occurred among all the important European Powers to secure the prior right to lend the money. England was China's old acquaintance; Germany was her new acquaintance; Russia would not only lend part, but would guarantee personally the whole of the loan. Throughout 1895, these assurances that Codlin's your friend, not Short, were urged on the government at Peking—which, in the end, succeeded in raising $80,000,000 on terms which Japan, in the days of her military success and well-organized finance of ten years later, was not able to command. Even the London *Economist* could not help describing the episode as "somewhat ludicrous"; although it talked very gravely of the political issues in the case.

Apparently, we are seeing now another and a similar international competition. The case, purely from a financial point of view, is all the more singular from the fact that a Chinese railway loan, even granting its entire soundness, offers no greater inducements than many excellent bond investments already on the markets. The popular notion that enormous interest rates are paid is erroneous. The $80,000,000 Chinese loan of 1896 paid 5 per cent., its issue price was 98¾, and it has lately sold in London around 104. The more recent Hankow-Shanghai railway loan paid interest at 5 per cent. and sold at 99. The question is not of the wisdom of offering such a price; the point is, that investment finance has apparently acted with a curious mixture of motives in the matter.

This conclusion is the more difficult to escape when we come to our own diplomatic demand that American capital be allowed to participate. American capital has of recent years been impressed with the fact that it has a good deal to do in financing its own investment interests. In 1906, our markets were declared to have borrowed $500,000,000 European capital for the purpose, and, even so, our new railway bond proposals failed to find a market. Only two weeks ago, it was announced as a timely and welcome achievement that we had obtained the assent of the Paris Bourse to an effort at interesting French capital in our one-half-billion dollars United States Steel stock—the apparent

purpose being to get foreign capital to take part of it off our hands.

It is quite true that in 1901 we got in the way of talking about "overflowing capital," and of New York as the money centre of the world. We invested in British consols and German treasury bonds; not to mention the handsome contributions made by our markets to the Japanese war loans. But these very investment undertakings have demonstrated the real nature of the situation. The American allotments of the British Exchequer loans have practically all been re-sold to London; so have the German bonds; so, in very large measure, have been the Japanese issues. This is not because of doubt about any of these investments; but, in the main, because American capital can do better at home, or in immediately contiguous states which naturally depend upon our markets. But if the lending to China is —as the State Department's intervention seems to indicate—primarily a diplomatic move, it opens up interesting considerations as to the longer future of both finance and diplomacy.

LONGMANS, GREEN, & CO., NEW YORK

THE YASNA OF THE AVESTA

in continuous treatment upon the plan initiated in the FIVE ZARATHUSHTRIAN GATHAS, by L. H. MILLS, Professor of Zend (Avesta) Philology, in the University of Oxford, A STUDY OF YASNA I., with the Avesta, Pahlavi, Sanskrit, and Persian Texts. The Pahlavi is given in the original character and in transliteration, the Pahlavi and Sanskrit being translated into English here, the Avesta in S.B.E., XXXI., 1887; the Persian is itself an interlinear translation of the Pahlavi. The Avesta Text is re-contractional with copious notes. The Pahlavi is re-edited from the *Zeitschrift of the German Oriental Society* with all the MSS. collated Bd. Lvii., Heft IV., 1903; the English translation of the Pahlavi is re-edited from the *Journal of the Royal Asiatic Society* for October, 1904; Neryosangh's Sanskrit is re-edited from Spiegel with the additional collation of five MSS., and for the first time translated. The Persian is from the Munich MSS. already partly edited in the Gāthas. An Appendix contains the accented Sanskrit Equivalents of the Avesta Text by the Author, issued upon the plan adopted by him with Yasna XXVIII. in Roth's Festgruss, 1894, and with Yasna XLIV. in the Acts of the Eleventh Congress of Orientalists held in Paris, 1897. Four photographic plates of MSS., with other illustrative matter, are added, pp. 163, to be had of F. A. BROCKHAUS, in Leipzig, 12s. 6d.; Yasna I. is especially valuable as it deals with the chief important questions of all the non-gathic Yasna. Also a Dictionary of the Gāthic Language of the Zend Avesta, being VOL. III. of the Gāthas, pp. 623-821, Leipzig 1903, price 12s. 6d., with 120 additional pages soon ready, pp. 320-622-940, 1909, £1.

A few copies of ZARATHUSHTRA, PHILO, AND ACHAEMENIDS AND ISRAEL, pp. 460+xxx, Brockhaus, 1905-06, are still to be had of the leading booksellers in Oxford at 12s. 6d. "He treats his subject thoroughly and exhaustively . . . deep and patient thought. . . ." J. J. Modi, Head Priest of the Parsis, Colaba, Bombay, in the *Parsi* of Bombay, 1895. "A wealth of learning and thought." the *Nation*, N. Y., Aug. 30, 1896. Also AVESTA ESCHATOLOGY compared with DANIEL and REVELATION, by L. H. Mills, 1908, to be had of Kegan Paul, Trench, Trübner and Co. The XXXIst Vol. of the SACRED BOOKS OF THE EAST, the YASNA, VISPARAD, AFRINAGAN AND GAH, pp. 400+xlvii, 1887 (same Author), is still to be had at 12s. 6d.; as is the ANCIENT MANUSCRIPT OF THE YASNA, collotyped in an unsurpassed manner in the actual size and colour of the Original, 770 photographs with Introductory Note by L. H. Mills, Ten guineas. This is the main document of the above-mentioned works—for the presence of the original of it in the Bodleian Mr. Mills is responsible, 1893.

"Professor Mills' name stands foremost in the ranks of those who have explored the field of Avestic literature."—The *Rast Goftar*, Bombay, April 18th, 1909. "Beyond question our leading authority now living, on the Gathas."—The *Nation* (N. Y.), Aug. 30th, 1906 (Dr. Gray). (Earlier, of the Gathas) Das Ergebniss einer erstaunlichen Arbeit sehr mannigfaltiger Art—unser Verständniss der Gathas mächtig gefördert.—Gott. Gelehr. Anz., Mai 13, 1893. "Insbesonders von Mills, der diese schwierigen Gedichte in gründlichster Weise behandelt hat."—Preussisches Jahrbuch (1897), Prof. Justi (Lexicographer). "Tous ceux qui s'occupent de l'interpretation des Gathas rendront hommage a l'immense labeur scientifique de M. Mills. . . . son livre reste un instrument indispensable pour l'étude."—Professor James Darmesteter, Revue Critique, 18th Septembre, 1893.

"Alles was für die Erklärung der Gathas nothwendig ist."—(so Dr. West in J.R.A.S.) "Immer wird es die Grundlage bilden, auf der sich jede weitere Forschung aufbauen muss. . . . einen hervorragenden Dienst."—*Zeitschrift der deutschen M. G.*, 1896 (the late) R. Pischel (first Sanskritist of Germany). A new edition has been inquired for, and a renewed Government subvention is expected from an antiquated engagement. A few copies are still to be had, upon exceptional request, and for Libraries, at £3. BROCKHAUS.

The Nation.

NEW YORK, THURSDAY, JUNE 24, 1909.

The Week.

Congress seems destined to round out its character as a body that neither was born to issues nor achieved issues, but had issues thrust upon it. Congress is chiefly being called upon to do things which it does not particularly care for, but which it is willing to take as the lesser evil. A Republican Congress has taken up tariff revision because of the possibility that there might be a Democratic House if it did not do something. To avert the peril of too much tariff revision, the idea of an income tax was brought forward. To avert the danger of an income tax, Mr. Aldrich has laid hold of the corporation tax. Tariff, income tax, corporation tax bear the vice of their origin. Tariff revision extorted from the Republican party under the threat of punishment at the polls has become in Congress a travesty of revision. The income tax brought forward in the past by those who had not the heart to wrestle with the tariff earnestly, is in danger of being abandoned as soon as an easier alternative presents itself. The corporation tax brought forward as an eleventh-hour remedy bears on its face the strong suspicion of being a temporary stratagem.

Attorney-General Wickersham displays great temerity in actually setting the machinery of justice in operation against the Sugar Trust. Mr. Earle of Philadelphia, and his counsel, have been subpœnaed to appear before a Federal grand jury, and bring with them all the evidence they have that the Sugar Trust had entered into a criminal conspiracy. But this evidence is precisely the same as that which Mr. Bonaparte, when Attorney-General, declared to be entirely insufficient to make out a case. True, Mr. Bonaparte had never seen the evidence, while Mr. Wickersham apparently has; but any Attorney-General who is able to decide by the light of his own inner consciousness that an indictment will not lie, must be so great a lawyer that his successor might well tremble at the thought of differing with him. Meanwhile, the sugar weighers are asking that their trial be deferred until autumn, on the ground that popular anger against the Sugar Trust is dangerously hot just now. The earlier they appear in court, the calmer may the verdict on them be. It is not as if the whole truth were out and waiting only for judgment. Only a few opening chapters of the sickening story of corporation thievery have been deciphered; the rest President Taft and the Attorney-General will surely grub out. Their discoveries about the leading criminals can scarcely whitewash the seven little mercenaries. Should one of the men higher up turn State's evidence—an event not altogether unlikely—what fuel might then be added to the fires of indignation! Big knave and little knave would probably fare alike.

It is a highly commendable move to try to keep open the door of diplomatic preferment to capable American citizens who do not happen to be rich. Of recent years, the expenditure required to support the social status of an ambassadorship abroad has made the official salary seem exceedingly meagre. The American Embassy Association, whose object is the correction of this anomaly, is therefore engaged in a good cause. One can not, however, quite escape envying E. Clarence Jones, the president of this organization, his pleasant task of making a "personal investigation" of the way our diplomats are housed abroad, the cost of living in foreign capitals, and the allowances made by other governments to their diplomats. It is possible that Mr. Jones, after having been fêted at such unpretentious establishments as that on Park Lane, London, may at least alter the wording of his propaganda, and abandon the idea of finding "more fitting abodes" for our diplomatic representatives. The abodes are "fitting" enough, if the salary were commensurate. Meanwhile Frederick A. Delano, president of the Wabash Railroad, announces his intention of sticking to railroading rather than take the Chinese mission. It is a bit odd to hear that he regards railroading as affording "no schooling in diplomacy." He must be a man with unusual definitions.

The business-like proceedings of the Direct Primary Association at Albany last week augur well for the early success of the movement in this State. The interest in some effective plan for giving political initiative to the party rank and file is too pervasive and emphatic to tolerate much longer the boss system of nomination. The Association is alive to the practical necessities of its propaganda, and shrewdly proposes to interrogate every candidate for the Assembly upon his attitude toward this question. Equally sagacious is the Association's project to organize in every county of the State a local league to forward this legislation. Gov. Hughes's letter to the Association disposes of the objection, if the machine dares longer to raise it, that direct primaries signify the abandonment of the party system. Its advocates intend that party leadership shall be a real and responsible leadership, not a subterranean manipulation of those who hold power without just title to power. It must cause searchings of heart to some of the advocates of the old régime to canvass the names upon the Association's roster of officers, so unquestioned has been their stanch party loyalty in the past, and so unassailable is their representative character. The advisory council is headed by Oscar M. Straus. It is all very well to scout at a lot of unpractical idealists, but when the practical men of affairs of unimpeachable standing in party councils declare their abhorrence of the present workings of the nominating machine, even the hidebound spoilsman may well think it good politics to "pander to the moral element."

With the enactment of the bill prohibiting race-track gambling in Florida, the year's campaign in State Legislatures came to an end. This movement has had the backing of no general organization whatever. Following the passage of Gov. Hughes's measure in New York, the idea has been taken up on individual initiative elsewhere. In Louisiana, the Locke bill went through with an incident recalling the dramatic action of Senator Foelker in this State. At Baton Rouge, a Senator so ill that he was hardly able to stand turned the tide in favor of the measure. In Cali-

fornia and Washington the race-track interests, seemingly strong at first, crumbled at the test; while Texas fell in line soon after. When it is recalled that knowing persons predicted Gov. Hughes's defeat last autumn solely on account of his anti-gambling campaign, there is food for study in the fact not only that he was elected, but that five States have followed with legislation patterned after his.

The trial of Patrick Calhoun in San Francisco came to have a national interest, and it is a national disappointment that the jury could not reach a verdict. That a defendant whose case in court had occupied nearly five months could be neither convicted nor acquitted in the end, is, as the presiding judge remarked, a deplorable event which should lead Americans everywhere to look to their methods of criminal prosecution. This San Francisco trial was, to be sure, hedged about by unusual difficulties. Public feeling had been inflamed; there were the sharpest differences of opinion in the community, making the selection of an impartial and competent jury almost impossible; and the whole contest had too much resolved itself into a battle between powerful interests. The long weeks spent in sifting the talesmen showed how general was the belief that getting the jury "right" was more important than the presentation of evidence. But over and above all this, was the ominous fact that, as Judge Lawlor said, the criminal statutes and judicial decisions of California had been made an intricate maze of subtleties and uncertainties, directly inviting such a fiasco as has now followed. The lesson is one that should be taken to heart in all the States. Until our criminal procedure is simplified and purified, there is little chance of convicting a rich and resourceful man "higher up," or even of making sure that, in ordinary cases, there shall not be a miscarriage of justice.

The new Secretary of Commerce and Labor, who had already shown his quality in dealing with the Director of the Census, has now applied a cold douche of common sense to a group of labor leaders. These worthy gentlemen have demanded the abolition of the "division of information," in the Bureau of Immigration. Their complaint was that it had been far too serviceable to intending and actual immigrants. Especially did they object to its aiding newcomers to find work. This was to take bread from the children's mouths and give it unto dogs—that is, to make it appear that workingmen could get along without unions. Unexpressed was the charge that immigrants had been told where men were wanted to take the place of strikers, this being, of course, the unpardonable sin. But Secretary Nagel has refused to accept the reasoning of Gompers and Mitchell, Chief Stone, and Commissioner-General Keefe. To their urgent representations, he replies that he will not make the change they desire; that he believes in giving immigrants all the assistance possible; and that, in fact, the distribution of these new workers has been made with great care, most of them having been sent out to farms and other places where there was a "shortage of labor." But that phrase will only heighten Secretary Nagel's offence, in the eyes of trades unionists. He seeks to relieve a shortage of labor. They would make it chronic. And the fact that the Secretary has both reason and humanity on his side, will not alter their opinion of his decision.

The social rebel's trade-mark and countersign is the straight line, which, being the shortest distance between two points, symbolizes all his aspirations. He sees a broker wolf devouring a lamb; the beast must be strangled on the spot. A drunkard jostles him; the saloon must go. Children are not being taught to earn their bread; close the mediæval schools and colleges! If our rebel makes a business of his rebellion, he again drives in a straight line across our civilization. There is in this directness an intellectual vigor, as well as an unwavering honesty, which forces admiration. It outdoes Nature's own blind gropings toward a better order; no gunner ever drives so true to his mark, for even cannon-balls move in a curve. Nevertheless, a straight line has its serious disadvantages, one among which our uncompromising reformers have, we fear, overlooked to their own eventual grief. This one the geometer points out when he declares that the line meets itself at infinity. In terms of reform this means that, if you push straight on to the limit in any direction, you will land in the very region you fled.

We see the working of this law oftenest nowadays in the remodelling of our social institutions. The Socialist, hating capital and classes, prays to be ruled by despots in an aristocracy whose leaders have more substantial power than mere stocks or bonds could ever bestow. From Chicago comes *Correct Thinking*, a new magazine devoted to the immediate enthronement of uncompromising common sense in school, church, and town hall. It demands that we employ a teacher for every ten pupils, evict all preachers, close every court and law school, and ostracize physicians—to say nothing of expunging from literature all ideas that occurred to anybody before Darwin wrote. If common sense, moving in a straight line, brings up there, one understands why it is that the most successful reformer often moves in a circle.

In the statistical debate over the relative growth of Eastern and Western colleges only one striking fact has appeared; that is the slight advance the latter have made over the former. So slight is it that, figuring one way you see it, and, figuring another way, you don't. All things considered, the situation must mildly disappoint the West. Foreign educators have been extolling its universities above the cis-Appalachian; one English critic rating Wisconsin as the first of the land. Home educators have shown the same preference. Particularly the great State universities of the Mississippi Valley now offer the undergraduate every fancy course, every patent rowing machine, and every social delight known to the most effete East. Only in their graduate schools do their bids fall short; but, in compensation, they are catching more utilitarians than does the East with their lectures on cheese-making and hog cholera. At the same time, "atmosphere" has been slowly gathering about the Western campus, local pride has added an ell to its girth, and the whole countryside has grown mightily in self-sufficiency. Finally, West has outstripped East in the rate of increasing population. We might expect, then, to see the star of our educational empire taking

its way toward the sunset at a meteor's speed. But it is not; and the only reason is that tradition and sentiment still overrule college boomers.

A five-foot shelf of books very frequently does represent a wide and lofty culture—for the friends of the owner of the shelf. To be the owner of only five feet of books means only too often that the other fifteen or twenty feet are in the parcelled possession of people who wanted a particular volume merely for a day or two, or for a tedious railway trip, or only to read to a sick friend. Lists have been drawn up of the hundred best books and the hundred worst books. But neither Sir John Lubbock nor Lord Acton nor Dr. Eliot has really met the point. The hundred best books are the books our friends lug away or send back with fingermarks on the margin. The hundred worst books are the books they leave us. We say this with all due consciousness of the fact that humanity shows itself at its very lowest in the man who locks his book-case and makes it a principle not to lend. Some golden mean must be found between being miserly and being ruined. Might not some enterprising publisher put on the market a library of a hundred selected books intended exclusively for being given away?

The effect abroad of the English wave of war hysteria, has not been exactly flattering to English pride. The world in general has wondered. German newspapers have made jokes about the imperturbable Briton. But perhaps the most unwelcome comment has come from the side of France. Some of the most serious French newspapers are now asking what value the Anglo-French *entente* can have, if England is in such a blue funk about her military helplessness. The readiness of Great Britain to come to the aid of France, in case of war, has been understood to be a part of the agreement between the two nations. Mr. Strachey writes incidentally in his recent book of "the knowledge that we should stand by France in case of any attack upon her by Germany." But the Paris *Temps* has been reading the confessions made for sentimental or partisan effect at the recent Press Conference, and discovers that a British expeditionary force would not probably exceed three or four divisions. But that will never do, declares the *Temps*, for an offensive alliance. If England is not able to launch sixteen or eighteen divisions, she had better keep out of the coil of Continental politics, and be once more peaceable John Bull at home in his tight little island.

It's a different Von Bülow who handed out cuffs and compliments last week, from the man who less than a year ago seemed in imminent peril of being ground to fragments between an infuriated Reichstag and a disconsolate Emperor. But the habit of loyalty is very strong in Germany, and after the Kaiser's diplomatic *coup* in the matter of the Balkans, William II and his man are firm in the saddle again. From the indifferent way in which Von Bülow has taken to speaking of his possible retirement from office, it may be gathered, first, that such an event would not quite overwhelm him, and, secondly, that such an event is not very probable before the adjustment of the difficult financial question. And when a man isn't afraid, and, in any case, doesn't care, he is eminently in the mood to have a little fun with his enemies. Von Bülow has been Chancellor since 1900—longer by five years than Caprivi, and by three years than Prince Hohenlohe. Ruling a Reichstag must be pleasant, but taking orders from the Kaiser is rather wearing, and the Chancellor's health is not what it used to be. If, after giving Germany a great navy, he should succeed in finding the money to pay for it, he might leave office with an enviable record.

The Federation of American Zionists has gone through its twelfth annual convention with no signs of wavering from its original aim, the establishment of a Jewish national state in Palestine. All over the world the Zionist party, in a strict sense, has held firm to the old programme. By contrast, the party led by Israel Zangwill has wandered pretty nearly over all the five continents and the seven seas without fixing upon any one location for more than a couple of months. Believing that any region which is fit for colonization would make a suitable second Palestine, they have found nothing that suits. The latest field of inquiry has been Mesopotamia, about which much talk is still under way. But already it is becoming evident that the economic difficulties of the project are enormous. Before the land can be occupied, it must be largely created anew by a vast system of irrigation. The Mesopotamian project is chiefly interesting because it shows that in the long run Mr. Zangwill and his followers here have been forced to perceive that sentiment is a very important factor indeed in Zionism. Mesopotamia is Biblical soil, and the distance to Holy Land is short. But the Zionists who have held fast to Palestine have their difficulties. That region, too, is not at present a land with milk and money blest. If it is to support a much larger population than it counts at present, large stretches of desert and waste must be reclaimed. The task that thus confronts the architects of a new Jewish state is a double one. They must make farmers out of the Jews, and they must make a land for them to cultivate. What has taken years and large expense on the fertile soil of Argentina, will call for greater labors still in the sun-baked territories about the Jordan.

No doubt, the Chinese railway loan, in which so many Powers are determined to have a part, is a serious affair, with important commercial and international relations, but the various steps taken in the matter seem irresistibly comic. The rush of the nations up to bewildered China with the announcement that she really must borrow some money from each of them, scarcely appears like a scene from real life; and the sudden awakening of the United States to the fact that this country, too, had a right to force some of its hard-earned dollars upon the Chinese, looked strangely artificial in a thrifty and close-fisted Uncle Sam. Now comes one more touch of the comic spirit in the pathetic appeal of England that, having kept out of the loan so long, we keep out altogether. Admitting our right, under the convention with China, the English Foreign Office begs us not to insist upon it, and thereby imperil an agreement which has been long and difficult in the drafting. To complete the humorous aspect of the whole transaction, the Washington dispatches say that our Government is more determined than ever to go ahead. We should like to oblige England, but a loan is thicker than water.

THE CORPORATION TAX.

Mr. Taft's quiet message to Congress last week deserves quiet study. The wrathful explosions which it has provoked in certain quarters are disturbing to the calm inquiry which ought to be made into the political and financial and social aspects of the measure which the President recommends. Beginning with the first, it is obvious that Mr. Taft has made this public intervention in the tariff debate, mainly to come to the help of Aldrich against the mighty. It is, primarily, a political move. Taxation is secondary. The Republican organization in the Senate was in danger of disruption. Aldrich and his phalanx had discovered that they would be outvoted on the amendment providing for an income tax. In their despair, they appealed to the White House, and the message is the result.

Its immediate political effect will doubtless be what was designed. The income-tax amendment will be beaten. When the President declares against enacting it at present, and urges the passage of a Constitutional amendment giving Congress, what it has not now, the undoubted power to levy an income tax of the broadest kind, party pressure is certain to bring over enough wavering Republican Senators to give Aldrich a narrow but sufficient majority. Indeed, the Washington dispatches make it clear that this result has already been secured. The inter-party alliance for the income tax confesses itself beaten. It will continue to fight, but acknowledges that the other side will win. Yet this does not mean that the whole tariff controversy will now come to a speedy end. Instead of cutting short the debate, we think it will be found that President Taft's message has greatly prolonged it. The new topic will precipitate new Senatorial *longueurs* and fury. On the merits both of the proposed corporation tax and of the income tax, many a Senator will desire to speak nine times the space that measures day and night to mortal men. The Democrats will wish to make party capital by showing that the new President is as skilled as the former in stealing their clothes—for he is now recommending what the Denver platform advocated, while his own party passed it over in silence. Hence we fear that Mr. Taft's plans to get away to his summer home by July 10 will be interfered with. He may go, or he may come, but the Senate debate will flow on.

In favor of a corporation tax as a fiscal measure, there is much to be said. It is a direct tax upon wealth. Moreover, it is a tax which cannot, except in very small part, be shifted to the consumer. This is challenged in the statement put out by the rump of the insurgent Republican Senators. They say: "It is well known that corporations, especially the larger ones, can in most instances shift the burden of the tax to the public by imposing upon the people increased charges and prices." But these amateur economists can scarcely have looked at the scientific discussions of the incidence and shifting of taxation, nor studied the actual facts of business. A tax on net earnings which exceed ordinary savings bank interest is one of the few taxes which are tardily if ever shifted. The case would be different if the tax were on gross earnings or gross product or on dividends or capital. But to tax net receipts is to tax a surplus. It does not heighten the cost of production, so that, under competitive conditions, no corporation could in consequence exact more for its goods or services. Even a monopoly could not do so, for even a monopoly would probably find that steady prices and large business would be more profitable than increased prices and lower gross returns. The tax on parlor-car tickets, during the Spanish war, was paid by the corporations. It is pretty safe to conclude that nearly every corporation would in like manner pay a tax on its net income. Considered merely as a means of raising revenue from those who can best afford to contribute, the corporation tax if it affected all securities alike, must rank high among those which come nearest meeting the canons of just taxation.

This fact, however, does not do away with the unhappy impression caused by this eleventh-hour throwing of the corporation tax into the Senatorial witches' caldron. Urged in the name of revenue, there is no certainty what the resulting revenue will be, nor whether it will be needed. Senator Aldrich has stoutly declared that it will not be; yet now he is meekly accepting an additional tax to raise indefinite millions. The President says: "I am informed that a 2 per cent. tax of this character would bring into the Treasury not less than $25,000,000." He does not state who informed him. No detailed estimates are offered. But it seems plain that the figures given to Mr. Taft put the returns from the tax far too low. The net earnings of the railways for the fiscal year ending June 30, 1907, were $833,000,000, thus alone yielding a revenue under the proposed tax of more than $16,000,000. It is hard to believe that the same tax on all the other corporations would not bring in a total largely outrunning the President's estimate. In any event, we have here one more hap-hazard experiment in taxation, vaguely undertaken, in a way that can only add to our national reputation for financial hugger-mugger.

Nor does it appear that the remoter consequences have been so carefully studied as they should have been. It is not certain that some corporations could not safely contest the constitutionality of the tax. Any of them whose earnings came in whole, or in part, from land, could apparently claim exemption under the decision of the Supreme Court that to tax the revenue from land, is to tax the land itself, thus making it a direct tax such as is forbidden to Congress, without apportionment. Even the choice of the corporation tax, therefore, may be, no less than would be the voting of an income tax, the "enacting of a lawsuit." And when we add the complexities and dubieties sure to arise from putting a swarm of Federal inspectors and bookkeepers into the offices of all corporations, great and small, we see reason enough for regretting the time and manner of bringing this vast project before a fatigued and fretted Congress.

NEGOTIATING A TARIFF.

A political philosopher of sufficient experience and detachment of view could readily find in the present activities of Congress an analogy to what biologists call reversion to type. Prior to the adoption of the Constitution, our national Congresses had been virtually nothing more than advisory conventions or diplomatic assemblies of sovereign colonies. The Constitution contemplated the creation of a national Legislature. What has resulted is an essentially diplomatic body whose statutes in their making bear more resemblance to the negotiating of a treaty than to the framing of a law. As a result, the na-

tion as a whole is represented in reality by the Chief Executive, not by Congress. It falls to him to impose upon provincial leaders the power of national opinion. By virtue of his office, and of his practically direct election thereto, he alone is the recognized Attorney of the People.

It is true that the framers of the Constitution foresaw divergent local interests that would conflict in the arena of Federal legislation. But they bad been mindful of the equality of the States in assigning two Senators to each and every commonwealth. And a lower house, constituted upon the basis of population, was supposed to guarantee directly an adequate reflection of popular sentiment. The Fathers did not, in all probability, enter very deeply into the philosophic distinction between the delegate and the representative, between the man who simply counted numerically as the index of local sentiment, and the man who undertook the responsibility of determining what was for the interest of his constituents. But having secured, as they supposed, a Federal Legislature, they seem to have had no misgivings that it might degenerate into an essentially non-representative body.

There never have failed to be clashings of petty local interests in Congress. But the issues of the Civil War and the subsequent problems of reconstruction had a solidifying effect that erased most regional differences. In 1861 the M. C. was for the Union and the war, or was a "copperhead." Up to 1876 the reconstruction acts and the war amendments to the Constitution kept party affiliations intact. With the subsidence of these issues, a new set of interests began to manifest themselves. These were essentially pecuniary, not political. But as they were to be served by the control of the tax machinery, these interests found it convenient to mask, so long as they could, in partisan disguises.

It is true that, on a relatively small scale, national economy, and sometimes even national solvency, had been endangered by what Congressmen now regard as the rather primitive process of "log-rolling." Localities have been able in the past to secure costly public buildings and disbursements for harbors and rivers by an alliance of representatives who conspired to promote their mutual inroads on the Treasury. But the growth of the Speaker's power converted this individualistic system of coöperative robbery into a method of collective "conversion" (as the wise call it), which required the party sanction. The real trellis-work upon which the parasitic form of degenerate legislation has climbed is found in the rules of the Senate. The right of unlimited debate means, at the limit, the right of individual veto of legislation. Of course, this right has to be exercised under such limitations as may be imposed by human capacity to keep talking. There is the equally efficacious check of not offending opponents overmuch. But in the last resort, as Senator Tillman has demonstrated, a determined, persistent, and aggressive individual Senator can foist an appropriation upon a general bill by simply holding up supplies for the entire government.

It is this situation which makes the tariff legislation of the United States to all intents and purposes a treaty between the great industrial interests whose ambassadors, under the title of Senators, raise or lower rates of duty in contemptuous disregard of the interests of the entire body of consumers. Senator Lodge has even declared the consumer to be only "a myth." At all events, the consumer's influence upon the great schedules of taxation is purely mythical. The Senate rules are practically those of international law. The equal sovereignty of all nations, *alias* Senators, is the cornerstone of all peaceful negotiation.

A pertinent illustration is furnished in Senator Bulkeley's recent intervention in tariff-making, not in his capacity as Senator from Connecticut, but as envoy extraordinary and minister plenipotentiary of the tobacco-growers. The action of the Concert of the Powers in Crete, for example, is not different in kind, but is presumably more laudable in character and intent, than the Bismarckian way in which Baron Aldrich is seeking to secure the maximum benefit for the protected interests. With a tariff policy such as we have long pursued, this perversion of the essential character of Congress is inevitable. It will not be until the people as a whole recognize the unmistakable usurpation of Constitutional function for sordid interests, tbat we can expect to recover a national Legislature imbued with real concern for national interests.

THE REAL STRENGTH OF THE BRITISH EMPIRE.

English opinion, it is reported, looks upon the meeting between Kaiser and Czar with equanimity. England nowadays is so disinclined to look upon anything with equanimity that her refusal to shape a new scare out of the periodical meeting between the two Emperors, may be taken as a sign of returning common sense in Albion. It would have been so easy to show how the interview in the Gulf of Finland was another staggering heart-blow at the Empire; how William II's purpose was to win Russia away from her friendly understanding with Great Britain; how Russia would be incited to antagonize British interests in Persia and persuaded to join hands with Japan against her present ally; how the dominions beyond the seas would thus be put in mortal peril as a preparation for Armageddon in the North Sea; how anything and everything else a nation's panic fostered by a yellow press can render conceivable, is bound to come. But instead the English nation has chosen to believe that the Imperial interview will actually assure the peace of Europe. The ruin of the Empire is perceptibly no nearer than it was on the afternoon before the interview, though, of course, it is much more imminent than before Lord Rosebery and Mr. Balfour delivered their speeches at the Imperial Press Conference. After all, it is possible that Parliament will close and Englishmen will enter the grouse season in a fairly composed state of mind.

Throughout her present sharp attack of nerves, nothing has been more striking than Great Britain's omission to find encouragement in any reserves of moral strength she might honestly claim to possess. She has weighed her chances against Germany's in terms exclusively of reeking tube and iron shard. When men have predicted the dismemberment of the Empire and the destruction of London by a German army corps, it seemingly has occurred to no one to inquire whether the British Empire and the German Empire do not embody certain diverse ideals which might have some influence in throwing victory to one side or the other. Moral issues, we admit, have no interest for the experts who balance broadside against broadside and battalion against battalion, and love to forecast the fate of battles by

the narrowest of arithmetical margins. Yet it is these same experts who, after the event, explain away their sad miscalculations by that despised moral factor. It was the superior moral weight of the Japanese cause that, by common confession, contributed as much as anything to the defeat of Russia. It was the moral superiority of the Boer cause that gave it two years of victory against tremendous odds. It may have been the needle gun and Moltke's genius that brought about the downfall of France, but Germany's moral right to make herself into a united nation played a sufficiently important part. Men and guns are not everything if they are arrayed against the trend of civilization and the spirit of the age.

When the British fire-eaters picture Germany as pouncing upon the Empire and seizing it for herself, it is pertinent to ask whether Germany's strength is such as to make her a fit ruler of dependencies. We may go further and ask if even that fear of a great Germanic empire in all Europe, can be anything but an empty fear. To exaggerate the power of the German army is only to indicate the limitations of German expansion. Prussian militarism may be justified in the eyes of most Germans today by the unity, the prestige, and the assurance of peace it has brought them. To the extent that the Prussian army has worked towards such ends, it has been a moral agent. But Prussian militarism will not retain its effectiveness when it sets out to conquer and keep down foreign nationalities. By so much as the Prussian element in the Hohenzollern dominions dwindles to a minority, by so much will it become more difficult to maintain a Hohenzollern empire that shall be at the same time a great hive of industry and an armed camp. All over Europe and the world the current runs away from war-lord and autocracy to democracy and self-government, and Hohenzollern ideals cannot in the end make head against it.

English rule, with all that can be cited against it in India and Egypt, still carries with it the fundamental principle of democracy. England is still the mother of parliaments and the inspiration for oppressed nationalities. Her Empire is mainly based on self-government; and even in India, where the problem is so immensely difficult, the English instinct for progress with prudence is now manifesting itself. Would it be foolhardy in an English statesman to declare that until Germany had thoroughly learned the lesson of democracy and the supremacy of the civil over the military authority, the British Empire has, in the long run, nothing to fear? It is hard to imagine Canada, Australia, or South Africa overrun by German troops. But even if we imagine the conquest as effected, it is quite impossible to think of Germany ruling these colonies. The process of sergeant's drill is not the right preparation for world-empire. The spirit of German government and administration must grow more supple and more modern before the war-lord can look toward domination over non-Germanic Europe, or dominions beyond the seas.

Not all the moral weight is on the side of Great Britain. The German nation has discipline, loyalty, laboriousness, enterprise, and method. British statesmen have conceded the Germans the palm for efficiency. Germany has no such internal sores as England's pauperism to weaken her. Her laborers work harder and fare worse than the English, but they have a greater assurance of immunity from starvation, or the poorhouse, in their old age. We may enumerate every fine quality that has contributed to Germany's leading place among the nations, and yet question whether expansion along undemocratic lines can go much further than it has gone with her.

THE TASK OF PRESIDENT ANGELL'S SUCCESSOR.

A recent visitor to the United States is reported as remarking that we Americans are no less excited over the choice of a president for one of our universities than over that of the President for the nation. The election of President Eliot's successor, which occasioned the remark, is safely over. President Angell's successor is still to be appointed—another appointment involving much more than local interest. Indeed, it is scarcely too much to say that in educational importance—which with us almost spells national importance—this choice is second only to that of the president of Harvard. In each case, the new president takes direction of a university grown great under his predecessor; in each case his problem is, not to destroy, or even to recast, but to restrain the excesses and to develop the strength of a valuable type of education. The incoming administration at Harvard promises changes of this progressive kind: the encouragement of scholarship by outward as well as inward sanctions, and the more philosophic control of the elective system. The successor of President Angell will have a task of great delicacy if he is to do likewise for the fine type of education represented by the State universities of the West.

Under President Angell, the University of Michigan grew, as it were, to manhood. And as a young man "feels his life in every limb," without as yet feeling the need of conscious control from the centres of brain and heart and will, so this university has come to live a life instinctive and peripheral rather than deliberate and central. There is room for doubt as to how far power should be concentrated in the hands of a university president; there can be no doubt that actual conditions at Ann Arbor call for change. Power has slipped from the president's hands, upward into the hands of the regents, sideways or downward into the hands of the deans. The regents have come to interfere in faculty appointments, promotions, and dismissals, and in the regulation of student activities; the deans, each intrenched in his own school or "department," have grown to be virtually autonomous. At the faculty meetings of schools other than the college proper—the "literary department"—the president has been of late not so much a controlling force as an honored guest.

The presidency has thus shrunk to the Headship of the College. Other "departments" of the university, each under its dean, have been walled off, each in its corner of the campus. The whole has been subject to irresponsible interference from without. This system has not been altogether justified of its children. Upon the wire-pulling, the "seeing" of high personages, the undignified procedure of university politics, in some cases barely stopping short of scandal, it is better not to enlarge. More important educationally is the fact that this system has compelled the university to leave unused much of the spontaneous energy of its teachers. More than one scholar, for instance, whose appointment has happened to land him in a "department" where only preparatory drill-work is done in his subject, has

not been permitted to offer advanced courses in another "department." There has been, we believe, no marshalling of the forces from the whole university—such as has recently been effected in certain studies at Harvard and Columbia. On the whole, there has been a scattering and a waste of energy, a failure to give employment to enthusiasm. Who shall say that the student has not suffered, as well as the teacher?

Hope appears in at least two directions. Michigan has so far foregone a large and costly graduate school. Many of its teachers, probably a majority, despite the promotion and consideration that have been made the rewards of "research," have given their best energies to "mere teaching." A president who, like Dr. Angell, should be himself a man of broad ideas in education, who should map out the whole province, who should allot to research and to teaching each its proper field, and who at the same time should offer a new *Lehrfreiheit* transcending department walls—would gain at once, we venture to predict, the enthusiastic support both of the "productive scholars" and of the teachers. Under such a president we might behold once more—despite the enormous numbers and the enormous "plant" of our larger colleges—a university whose basis would lie in the contact between a teacher and a student: "a boy at one end of a log and Mark Hopkins at the other."

Again, there is hope in the very growth which has brought about present conditions. The University of Michigan, unlike many a university in the West and the South—and, for that matter, the East—need make no concession or compromise for the sake of numbers. It has always at its doors an eager throng, waiting to enter and ready to work. The pose, too common at Eastern colleges, that study is rather discreditable—something to avoid if you can, to dissemble if you must—is refreshingly absent from student life at Ann Arbor. On such a body of learners as a foundation, the natural superstructure is a high standard of teaching, a free and flexible organization, and a rational, a central yet widespread, conception of what all this educational activity is about. After all, deans and regents are "almost human." Jealous of power as they may be, the more public-spirited of them cannot but acknowledge the better way; and the others must follow. The delicacy of his task will not appal the new president if he possesses anything like President Angell's tact and insight. He will perceive that for the material and the spiritual bases which make possible the changes he finds necessary, thanks are due to President Angell. At the same time he will realize that the opportunity is his own to make of the University of Michigan a leader among our State institutions.

ON STUDYING SEVERAL LITERATURES.

A Columbia professor has written a book which he calls "Studies in Several Literatures." It is rather too earnestly named. The author chats about Greek, Latin, Russian, French, English, and American writers; but the fifteen papers in his volume are in no wise reminiscent of the lamp, nor are they addressed to pondering readers. Neither is it quite accurate to speak of the "studies" as *in* several literatures. They are all in one. The writer is a faithful friend to the modern man with but one literature, and not very much of that. The aspects of foreign literatures which attract him, modern or ancient, are those which are most closely parallel to the most familiar aspects of contemporary life—and contemporary life in America. Thackeray is little read outside of England, he thinks, because, to enjoy him, we must know English life and London life." We enjoy Longfellow, because he always writes of women like a native-born American—as, witness the arch-Americanism of his "Trust her not, she's fooling thee." The professor seems to have forgotten for the moment that the line is a literal translation of "Vertrau ihr nicht, sie narret dich," in the old German folksong. If he had thought of the fact, it would only have strengthened his conviction that all interesting people are exactly like ourselves. For he points out with pleasure that the letters of the Athenian Alciphron reveal a sister to the inconsequential and slangy miss who lives just around the corner. He declares that Nausicaa is as "sweet as though we had just met her playing tennis." If she is no sweeter than so, we are tempted to ask, why learn Greek—especially if one has access to a tennis-court?

If Mr. Carnegie had been fortunate enough to hit upon some of the passages in which Homer or Virgil anticipated the ideas of the Twentieth-Century American, he would not have deemed hoar antiquity so dull and profitless. He would have learned that there were paint and powder in the days of Pericles, political rings in Rome, and monopolistic enterprises on the banks of the Tiber. In reading that Cæsar combined interests in finance, libraries, and the general improvement of the state, his bosom might have felt the fraternal throb. If he had tarried long enough to discover that even the Homeric Greeks washed their linen, that Plutarch's countrymen used bait for catching fish, and the guests of Petronius sometimes suffered from indigestion, he, too, might have cried, "Why, this is life! This stuff is immortal!" At any rate, such seems to be the prevailing fashion among historians, critics, and novelists, of interesting us in our foreign neighbors, living and dead. They would end the feud between the ancients and the moderns by the simple process of proving there were no ancients. Or, rather, they would consign the differences of the ancients to the grave-digging "classicist, the antiquarian, the philologist," and consecrate their resemblances to immortality along with our own imperishable transcripts of life. For, as our professor declares in his praise of Zola:

> The centuries of dreaminess have gone by perhaps forever, and to-day man looks with keen, unclouded vision into the verities of his existence, asking no one to prophesy smooth things, but banishing illusions, uncovering nakedness, and facing with a certain hard composure, born of cynicism, the ghastly facts that render human life so terrible.

That final insight into the facts of life is exactly what philosophers from Plato to William James have yearned for; and now at last they have it, or at least "man" has it, which, we suppose, means Tom, Dick, and Harry have it. If such be the case, man may well leave the cemetery of dreams to the literary sextons and go about his great task of uncovering nakedness. Embrace the sovereign assurance that 1909 is the measure of all things, and the study of several literatures will be much simplified. Discard from the literature of the world everything which does not prove that we have gained the ultimate conception of things, and the problem

of universal culture will be solved. In fact, it is not clear what profit there is in going abroad in time or space at all, if we may safely ignore everything but what we have seen or heard at home. If everything of durable value for the spirit is represented in our modern life and translated into the terms of the hour, why read anything but the newspaper? Such reading will furnish us our heart's desire of the "ghastly facts that render human life so terrible," and those are the facts most worth holding in the keen unclouded vision of the modern man. We cannot be humble in these days; for we possess the truth for which former generations travailed. The finality of our vision is what exalts our pride. We do not think that the ultimate insight of which we are the unique possessors is exhilarating; on the contrary, it leaves us breathless, thunderblasted. Yet, after all, this thought, as we look back over the waste "centuries of dreaminess," sustains us: We are the people; we have banished illusions.

No doubt it is instructive to read Euripides in the light of Shaw, Propertius in the light of Alfred de Musset, and the New Testament in the light of M. B. Eddy. But there are some pretty magnificent things in heaven and earth which cannot be illuminated by such modern tapers. Milton reads best in his own light; so does Virgil; so do Sophocles and Homer. They refuse to be dragged into the light of our common day. They refuse to reveal themselves to the unclouded vision of the man with one literature. They must be sought out where they may be found and read under the light of the inextinguishable dream which the composed cynic at the centre of his Ptolemaic universe thinks he has banished. The illusion that "man" has banished illusions is the rampant egotism of the hour. The right study of several literatures does not end in a proud assurance that we have fixed the sense of life for all time but in a humble conviction that in ten thousand years our notion of the verities of existence will be as obsolete as Homer's or Professor Peck's.

SAINTE-BEUVE.

I.

Professor Harper has the distinction of writing the first book on Sainte-Beuve in English.* He gives evidence of long and careful study of Sainte-Beuve himself, and of most that has been written about him, but should have reserved space for a more systematic discussion of Sainte-Beuve's ideas and his place in criticism. As it is, his work strikes one as a rather loosely written biography, mainly devoted to Sainte-Beuve's youth, or at least to the period before 1848. Professor Harper would no doubt justify this emphasis on biography by the example of Sainte-Beuve himself; but he has also been unduly influenced, perhaps, by recent French writers on Sainte-Beuve—notably M. Léon Séché—and their tendency toward somewhat petty and prying personal details.

Sainte-Beuve is being made the victim of his own method. His biographers are following with a vengeance his advice to examine the seamy side as well as the right side of the tapestry, and to eschew the academic bust. It has become almost the fashion of late in interpreting Sainte-Beuve's behavior to look for the mean, and even the Machiavellian motive. Examples in Professor Harper's book are his assertion that Sainte-Beuve deliberately used the incident of the hundred francs and the smoking chimney in 1848 to attract attention to himself; his insinuation that even in his small acts of charity Sainte-Beuve was merely draping himself for posterity. As a matter of fact, Sainte-Beuve joined a genuine kindliness to a very great irritability. In determining points of this kind, Professor Harper should have given at least as much weight to the testimony of the men who came closest to Sainte-Beuve toward the end—Taine, Renan, Scherer, Jules Troubat—as he has to the spiteful allusions in the Journal of the Goncourts. It is true, as Professor Harper says, that Sainte-Beuve's life was pitched low; but this lack of elevation in him should interest us mainly in so far as it images a philosophy. In other words, biography in a subject of this kind should be put into the service of ideas, if it is not to degenerate into gossip. The side of Sainte-Beuve's life that was pitched lowest has perhaps been made too much of by the biographers, for the simple reason that Sainte-Beuve kept it so completely out of his writings. He is in this respect at the very opposite pole from writers like Herrick, who boasted, as Martial had boasted before him, that, though his "muse was jocund, his life was chaste." But there is a larger aspect to the subject that should not be passed over in silence; and this appears in Sainte-Beuve's strange claim that he had attained to wisdom "like Solomon and Epicurus," through pleasure. Wisdom worthy of the name must be, it should seem, positive rather than negative—an insight and not a mere disillusion. In one passage Sainte-Beuve actually asserts that the truest vision of life is that attained *sous le jour pâli du lendemain des plaisirs*, or as the American comic writer has expressed it, in "the cold gray dawn of the morning after."

II.

There is also a larger aspect to what seems the most purely personal of Sainte-Beuve's feuds and animosities. It is only by seizing on this larger aspect, as recent students have on the whole failed to do, that we can raise the discussion of Sainte-Beuve's attitude toward his contemporaries from the region of gossip into the region of ideas. The point of departure for any such discussion should be Sainte-Beuve's own words:

> Parties and sects have a deadly grudge against any one who, having passed through them, has refused to bind himself to them irrevocably.
>
> I have given no one the right to say "He is one of us." I have certainly had my vices and weaknesses, but it is for what is good in me, for my love of integrity and truth and my independence of judgment, that I have irritated so many people in my life and aroused so much wrath.

To take a concrete instance, Sainte-Beuve, in breaking away from Lamennais and his group, incurred the wrath of the ultra-democrats. Lamennais seems to Professor Harper a sort of saint of democracy. As for Sainte-Beuve's later utterances on Lamennais, says Professor Harper, there is scarcely a single one of them which is not a "shadow on his own memory." But for the impartial observer, Lamennais is simply a fanatic who suddenly abandons one violent extreme, leap-frogs over the heads of his moderate friends, as Sainte-Beuve puts it, and lands in an opposite but equally violent extreme. Why was it becoming increasingly difficult for Sainte-Beuve in the years from 1835 to 1840 to espouse the humanitarian enthusiasms of a man like Lamennais, his faith in the regeneration of society through the principle of brotherly love? If Professor Harper had found the right answer to this question, he would not have been so puzzled by Sainte-Beuve's assertion that the article on La Rochefoucauld (written in 1840) marks an epoch in his inner life. Sainte-Beuve had simply come to feel with La Rochefoucauld that when in ordinary human nature, human nature that has not accepted allegiance to something higher than itself, there is a conflict between egoistic and altruistic motives, it is the egoistic motives that will prevail. Criticism comes to consist more and more for Sainte-Beuve in searching out this triumphant self-love under the thousand specious disguises that it is wont to assume. In his last article on La Rochefoucauld (1863), Sainte-Beuve speaks of the "subtilized and quintessentiated ego" he often detects

*Charles-Augustin Sainte-Beuve. By C. M. Harper. Philadelphia: J. B. Lippincott Co. $1.50 net.

even in utterances and points of view that seem most sublime and impersonal. Man, the everlasting prisoner of his self-love, "cuts and carves everything he encounters on his own pattern." He continues:

> And I myself, first of all, I, who am writing this, if I force myself to love what I am not, or even the contrary of what I am, it is not through detachment from the ego; it is perhaps because I take pride in being nothing in particular, and like myself better apparently, under this broken, fugitive, and multiple form, than under any other. No, no, honest folk, La Rochefoucauld, rightly understood, is not so easy to refute as you suppose.

Passages of this kind should make clear why Sainte-Beuve was at best but a half-hearted humanitarian; why he did not feel sure, like Professor Harper and so many other educated persons of the present time who are drifting more or less consciously toward Socialism, that "in the Revolutionary doctrines of equality and fraternity there is an ideal, a religion, capable of filling the soul and occupying the energy of society"; why he looked so doubtfully on the attempt of man to set up his own image for worship in the sanctuary left vacant by *la grande absence de Dieu*. Professor Harper says that Sainte-Beuve "strangely avoids Molière." In reality, Sainte-Beuve has written better things about Molière than has any other nineteenth century critic; and in one of the best of his Molière passages, he tells us that to "love Molière is to make sure of not falling into a smug and limitless admiration for a humanity that idolizes itself, and forgets of what stuff it is made and that it is always, try as it may, only puny human nature." This humanitarian infatuation and the conception of progress that goes with it has especially impaired Professor Harper's treatment of "Port Royal." Apparently neither the Port Royalists themselves nor Sainte-Beuve could hope so long ago to arrive at any clear notion of Christianity. "It was no doubt easier in 1840, than it is now," says Professor Harper, "to overlook the advantages and even the existence of what might be called the religion of Jesus." What a pity Pascal came too soon to be a true Christian!

III.

As in Sainte-Beuve's relations to Lamennais, so in his relations to other contemporaries—Chateaubriand, Hugo, Balzac—there is a larger aspect that must be emphasized if we are to rise above the level of gossip. The romanticists also bore Sainte-Beuve a deadly grudge for having refused to bind himself to them irrevocably, and ascribed to mere jealousy and rancor opinions that really contained a serious judgment. What concerns us, after all, is not the degree of indelicacy Sainte-Beuve displayed in the time and mode of his attack on Chateaubriand, but the truth or falsity of the attack itself: the charge, namely, that Chateaubriand was the first great writer of the decadence, the writer who changed the capital of French prose from Rome to Byzantium, who substituted for a literature of thought a literature of images and sensations. Like Goethe, Sainte-Beuve, as he grew older, tended more and more to side with the Olympians against the Titans. It is as a humanist that he protests against the violence and excess of Hugo's romanticism, against the violence and excess of the naturalism of Balzac. Later, under the compliments he lavishes on his friend and admirer Taine, one can distinguish the same note of protest against the dehumanizing tendencies of an excessive naturalism. This protest did not keep Taine from asserting shortly after Sainte-Beuve's death that Sainte-Beuve was a thorough-going naturalist, as complete and consistent in his method as Taine himself, only somewhat less systematic; and of course Sainte-Beuve writes that his ambition was to be a *naturaliste des esprits*, and in the third volume of the "Nouveaux Lundis" he outlines a naturalistic method that tends toward scientific determinism; but in practice this naturalism is always tempered by humanism. Nothing is more essential in the study of Sainte-Beuve than to bring out the interplay, not to say the conflict, between his naturalistic method and his humanistic standards. No previous critic carried into his work so keen a sense of relativity. With an almost unparalleled fineness of shading and feeling for the *nuance*, Sainte-Beuve establishes the relation between a work and its author, between the author in turn and his family, race, and age; and then between the age and the preceding age, and so on in widening circles; but he does not take the last step and look on the living individual, especially the superior individual, as a mere link in the chain of phenomena. Just as in "Port Royal" there is a point where he pauses and refuses to apply his naturalistic dissection to the ultimate raptures of religion.

The rôle of Sainte-Beuve's humanism in tempering his naturalism may perhaps best be studied if we compare him with Taine in his treatment of a particular topic, such as the theory of the "master faculty." Of course, Sainte-Beuve differs most obviously from Taine in loving to particularize rather than to generalize, to deal with men singly rather than "in zones and layers," to feel life in its infinite complexity rather than to impose upon it logical formulæ. Yet Sainte-Beuve for once comes near being dogmatic in his assertion that man is determined in his aptitudes, not by any choice of his own, but by nature. Thus of Horace Vernet he writes:

> Everything on both his father's and mother's side had contributed to make of him a man of the brush—involuntarily and irresistibly a painter; his hand, delicate, slender, long, and elegant, was born ready formed and fitted to paint, as the foot of the Arab horse is to run.

Piron, again, he describes as a "pure piece of organized matter, an admirable automaton formed and set up by nature to launch sallies and epigrams." "Somebody has said: La Fontaine grew fables, Tallemant bore anecdotes, Petrarch distilled sonnets, Piron *sneezed* epigrams. *Sneeze* was Piron's own word. Well, you can't hold back a sneeze." Indeed, man is so little a free agent, there is a "strange fatality that puts such a deep and distinct mark upon him from birth and childhood," that, according to Sainte-Beuve, only two hypotheses are logically possible. One may note in passing that Sainte-Beuve overlooks a third hypothesis: that embodied in the Oriental doctrine of Karma, and recently discussed by Mr. G. Lowes Dickinson in his address on immortality, without any giving of credit. If we are religious, says Sainte-Beuve, we should believe that man is supernaturally determined, that is, accept in some form the doctrine of divine grace or predestination. If we are not religious, we should admit that man is determined by nature. "But, after all," Sainte-Beuve concludes, "most minds are neither religious nor the contrary. They float around in the intermediary space, and shrink from consequences; they remain at the half-way house in everything. This is what is called common sense—that is to say, the average degree of illusion."

IV.

As a matter of fact, Sainte-Beuve refused to be impaled on the horns of his own dilemma. He left it for Taine to rise superior to the average degree of illusion known as common-sense and assert that the "human spirit is constructed as mathematically as a watch" (the master faculty being, of course, the main-spring that imparts a "fatal and irresistible movement" to all the rest). For, if Sainte-Beuve as a naturalist believed in the master faculty, as a humanist he demanded the balanced faculty, the faculty that is kept under control and tempered by its opposite. He was ready enough to grant that a Piron was a mere machine for making epigrams, but not that the really great writers of the world have been nothing more than "sublime automatons and monomaniacs of genius." The contrast is striking between the "gentle" and humane Shakespeare of Sainte-Beuve and the Shakespeare of Taine, who is a mere unchained force of nature, the "most immoderate of all violators of language." Skeptical as he was of man's power to put a check upon himself, and

yet believing as a humanist that art requires restraint, Sainte-Beuve was led to exalt a critic like Boileau, who was a visible principle of authority, and supplied a Molière and a La Fontaine with the curb that they might not have found in themselves. It was through the lack of an outer curb of this kind that the writers of his own time, notably Hugo and Balzac, seemed to Sainte-Beuve to have fallen into Titanic unrestraint, or, as he expresses it, to have become "drunk with their own wine."

At bottom, in his attitude toward the master faculty, toward what he calls the "battle between the naturalistic and Christian moralists," Sainte-Beuve remains, as in other respects, a skeptic:

> The irreligious excess consists in the negation of free will and in a sort of predestination, but purely physical and material. . . . How many contrasts and oppositions! Before this sea of human opinions, as on the brink of an ocean, I wonder at the ebb and flow. Who will tell me the law of it all?

Sainte-Beuve saw all that was implied in the weakening of traditional standards in literature and religion, he saw the approach of the "great confusion"; at the same time he was too clear-sighted really to warm up to the new religions that were being offered as substitutes for the disciplines of the past. The underlying method in all these nineteenth century attempts at religion —whether it be the religion of Passion, or the religion of Beauty, or the religion of Science, or the religion of Humanity—is always the same: to take some element of human nature that is immensely important, indeed, but still secondary, and then try to exalt it to the supreme and central place. We must realize the completeness of Sainte-Beuve's detachment from every form of faith, new or old, if we are to penetrate to the last desolate depth of his inner life (*jusqu'au fond désolé du gouffre intérieur*). "The only unity I am ambitious of," he writes, "is that of comprehending everything." But mere comprehension is not in itself a principle of unity at all, but rather of dispersion. In aiming at nothing beyond comprehension, Sainte-Beuve was destined to become, as some one called him, the Wandering Jew of the intellectual world. Naturally enough, he complains in his letters of suffering from the "absence of fixed pole and centre," and seeks an escape from the "void that mined his breast" in unremitting toil.

V.

It is evidently as a *naturaliste des esprits*, and not as a humanist, that Sainte-Beuve has been influential. For his successors he has been above all, as some one says, a great doctor of relativity. "He has, even more than Sainte-Beuve, from whom we are all sprung," writes Anatole France of M. Lamaître, "the sense of the relative." With the growth of this sense of the relative, masculine judgment and the feeling for standards have tended to weaken and disappear. Sainte-Beuve himself is more concerned in arriving at horizontality, if we may be allowed the word, than in determining altitudes. There is an element of truth in the saying that in Sainte-Beuve all men are six feet tall. He exercises that instinct for literary portrait-painting, the incomparable gift for psychological biography that is his own master faculty, with at least as much complacency on second-rate as on first-rate writers. He says it is a part of his method to study the faults of the master enlarged and exaggerated in the disciples. Now, the fault of Sainte-Beuve that his own disciples have exaggerated is the tendency to abound in biographical small-talk, and at the same time lose sight of the eternal values. The moment would therefore seem opportune to exalt Sainte-Beuve's individual achievement, but to react against his influence and method. What is most needed just now is not a great doctor of relativity, but rather a critic who, without being at all rigid or reactionary, can yet carry into his work the sense of standards that are set above individual caprice and the flux of phenomena; who can, in short, oppose a genuine humanism to the pseudo-humanism of the pragmatists. The world has been giving a large share of its attention of late to M. Bergson and his philosophy of vital impulse (*élan vital*). A critic of the kind we have described might be counted on to proclaim a philosophy, not of vital impulse, but of vital unity and vital restraint—restraint felt as an inner living law, and not merely as a dead and mechanical outer rule. We may venture the paradox that criticism would derive more benefit at present from a second Boileau than from another Sainte-Beuve; from a critic concerned, above all, with making keen and crisp discriminations between different degrees of merit or demerit. In other words, the age offers an opening for satire; but it must be constructive satire, satire that implies standards, and is "purified," as Boileau claims of his own, "by a ray of good sense." Nothing could be more inspiriting than some twentieth-century equivalent for those first satires of Boileau, when the bad authors went down before his epigrams like the suitors before the shafts of Odysseus.

In the meanwhile, Sainte-Beuve will come to be looked on more and more, in Anatole France's phrase, as the universal doctor, the Saint Thomas Aquinas of the nineteenth century; not as the greatest man of the century, but possibly as the most representative, the one who embodied most completely its aspiration toward horizontality, its magnificent widening out of knowledge and sympathy, and, some would add, its lack of adequate central aim. If Professor Harper's book, in spite of considerable psychological finesse and grasp on ideas, is inadequate, it is in part because the subject is one of the most difficult and complex in modern literature. If the book is readable after all, it is because Sainte-Beuve, though one of the most difficult of subjects, is also one of the most fascinating.

Irving Babbitt.

NEWS FOR BIBLIOPHILES.

The appearance of Vol. VII of the "Catalogue of Books in the Library of the late E. D. Church," edited by George Watson Cole, marks the completion of the most important catalogue of a library of its size which has ever appeared in this or (so far as we know) any other country. The title page of almost every book is reproduced in facsimile, and, except in the case of the very largest books, the reproduction is the size of the original. The collations are full, and copious references are made to other bibliographical works. A general sketch of the author's writings in many cases precedes the descriptions of the books.

The most important portion of this volume, and the glory of the library, is the Shakespeare collection. The ninety-one numbers filling 206 pages of the Catalogue, with ninety-one facsimiles, forms what is, as far as it goes, the best bibliography of the early editions of Shakespeare yet prepared. All early editions of the poems and plays, even though they are not in the library, are mentioned in the comment, though not fully described. Mr. Cole has submitted check lists to the owners or custodians of all the important Shakespeare collections here or abroad, and, with three notable exceptions, his queries have been answered fully and freely. In a table he exhibits the relative richness of various libraries in editions before 1700, showing the issues before 1623 separately, and showing also the number of duplicates. In editions before 1623, the date of the first folio, the Bodleian Library possesses eighty-three different books, the British Museum eighty, and the Capell collection in the University of Cambridge sixty-seven. These are the three great public collections in England. The most important private collection is the Duke of Devonshire's with sixty-one different books before 1623. Then comes the Church collection, the fifth in order of completeness, with fifty-four different editions, followed by the Huth collection in England, with forty-three early editions, and William Augustus White's collection in Brooklyn, with forty. If editions up to 1700 are included, Mr. White's collection stands third, with 100 different editions, being surpassed only by the British Museum, with 169, and the Bodleian Library, with 156. The Church collection of the four folios with the various imprints is the most complete known, surpassing those of the British Museum and the Lenox collection.

The early editions of "Venus and Adonis" and "The Rape of Lucrece" are so rare that one early edition of either would make any library notable. Unfortunately Mr. Church never had the opportunity to

secure any one of the earlier editions of the "Venus and Adonis." Of the thirteen known copies of the eight editions issued before 1623 not one is to be found in America. Robert Hoe has the ninth (1627), Marsden J. Perry has the twelfth (1636), and William Augustus White and H. C. Folger, jr., each have the thirteenth (1675).

Of "Lucrece" Mr. Church was fortunate enough to secure the Locker-Lampson copies of the first edition (1594) and the fifth edition (1616). The library contains also the sixth edition (1624) and the eighth (1655). Mr. Church's copy of the first edition of the "Sonnets" (1609) is doubtless the finest known, having been George Daniel's, and bought at his sale in 1861 by Almon W. Griswold. An earlier owner was Narcissus Luttrell, whose initials and "pretium IS." are on the title page.

The Spenser collection in the Church library is the most complete in this country, including, as it does, the first edition of "The Shepheardes Calender" (1579), the Gott copy, imperfect, but the only one in America.

For the first time (so far as we know) accurate leaf by leaf collations of the first editions of the Waverley novels are given. These books contain an unusual number of half titles, and in almost all bound copies some leaves are lacking. These collations will therefore prove most useful.

The Milton, Lamb, Thackeray, and Lever collections are other notable series described in the present volume.

Correspondence.

SHAKESPEAREAN NOTES.

To the Editor of The Nation:

Sir: The letters that appeared recently in the *Nation*, and those that I have received from correspondents in this country and abroad, prove that there is abundant literary matter on the subject of mediæval trial and execution of animals. Professor Dowden writes that he has somewhere a French book on trials of animals, but cannot at the time lay his hands upon it; and Prof. Byron Rees of Williams College refers me to William Jones's "Credulities Past and Present" (1880). To what I said (see the *Nation* of February 18) of Baring-Gould's "Curiosities of Olden Times" (1896) I might have added that he cites authorities in Latin, French, Spanish, Portuguese, and Italian on this and kindred topics, in his interesting and amusing chapter on "Queer Culprits" (pp. 57-73); illustrating the trial and execution of cocks, assumed to be in league with the devil, for laying eggs from which were hatched *basilisks*, or terrible winged serpents—mentioned six times in Shakespeare ("Winter's Tale," i. 2, 388; "Henry V." v. 2, 17, etc.), and four times as the synonymous *cockatrice* ("Lucrece," 540; "Twelfth Night," iii, 4, 215, etc.); and not unknown in poetical and rhetorical zoology (in Pope, Southey, Carlyle, *et al.*) down to the present day. These old writers also tell us of the ecclesiastical proceedings against snails, flies, mice, ants, caterpillars, etc. Some of the legal questions raised in these trials by Bartholomew de Chasseneux, a noted lawyer of the sixteenth century, and other eminent authorities of those and earlier times, were almost as profoundly ridiculous as certain that are urged to impede the course of justice in our day; as, for instance, whether ants and other insects could be legally cited to appear before the court, and whether, in default of their so doing, the prosecution could lawfully be carried on. Chasseneux satisfied himself that this was in strict accordance with law, adducing sundry examples and precedents. He asserted, indeed, that a priest once excommunicated an orchard, to which children resorted to steal and eat apples when they ought to have been at church, and the penitent trees produced no fruit until the inhibition was removed! The same erudite functionary, in 1510, was appointed by the authorities of Autun to be advocate for the rats when tried for their devastation of the harvests in Burgundy; and when the rodents, after due summons, failed to appear on a fixed day, he pleaded that they had been delayed because the roads were infested with cats, and the trial was adjourned to another date. In 1487, snails were sentenced to excommunication at Mâcon, as caterpillars were in 1585 at Valence; and in the sixteenth century a Spanish bishop ordered all rats and mice to leave his diocese, whereupon they betook themselves to an island which he surrendered to their occupancy. Even as late as the eighteenth century similar proceedings were taken against caterpillars by a grand vicar of Pont-du-Château, in Auvergne.

A case even more curious than that of the condemned apple trees is recorded in Benoît's "Histoire de l'Édit de Nantes." A Protestant chapel at La Rochelle was demolished by church authority in 1685. The bell was whipped for having served the heretics, and was then buried. Later it was disinterred for Catholic use, was catechized, compelled to recant, and promise never again to relapse into sin, after which it was duly baptized and given to the parish of St. Bartholomew.

When hundreds of facts like these had been recorded in print for centuries, it is remarkable that all the editors of Shakespeare appear to have overlooked them, and that Dr. Furness, in his encyclopædic edition of "The Merchant of Venice," could find no note on Gratiano's hanging of the wolf, except the absurdly irrelevant one by Steevens, to which the most accomplished scholar and critic of our day could add nothing but the suggestion that the passage might be an "actor's addition" to the play. He amply makes amends now for this injustice to the dramatist by his extremely interesting letter concerning Count Mümpdelgart (in the *Nation* for March 4), with the quotation from "the honest Jacob's" journal of his master's travels in England.

It is to be noted, however, that the animals there mentioned as being "hung on a gallows as they do wolves" were not tried and executed by hanging, but were killed without judge or jury, and "skinned" before being thus exposed, apparently as a warning to their predatory kindred, or, perhaps, in clownish imitation of the judicial trial and punishment to which domestic animals guilty of similar offences were subjected. So far as I can find, wild beasts were never accorded the right of trial. The only law for them was that of the modern Judge Lynch. If Gratiano's wolf was "hanged for human slaughter," such was the case with him, and Shakespeare gives us no hint to the contrary. I suspect, indeed, that the reference to hanging is purely rhetorical, as all those quoted by Professor Feipel, in the same number of the *Nation*, certainly are. Shakespeare emphasizes the Pythagorean allusion to the wolf by adding what Dr. Furness at first suspected to be an interpolation: Shylock's "currish spirit" was not the "fell soul" of an ordinary wolf, but of one that had been guilty of "human slaughter," such as the Jew meditates, and had been hanged for it, as the Jew deserves to be.

It is quite in Shakespeare's manner to intensify a figurative expression by thus "piling it on," so to speak; as—to take the first example that occurs to me—in "Lear" (iv. 7, 36), where Cordelia, referring to the turning of her father out of doors in the storm, says—not simply, "I would not have treated a dog so!" but—

> Mine enemy's dog,
> Though he had bit me, should have stood that night
> Against my fire!

By the way, all the passages cited by Professor Feipel allude to the dog, and those from Shakespeare illustrate his many contemptuous references to the animal, which have led more than one good critic to assert that the dramatist never has a good word for the dog. An article that I cut from a literary journal ten or more years ago remarks:

> Nearly everybody loves or at least admires a dog; but Shakespeare, if one may judge by his writings, does neither. Dogs are treated by him with contempt; not a word has he to throw to them but words of obloquy and shame. . . . This startling fact is called to mind by Sir Henry Holland's "Recollections of Past Life," when he states that "Lord Nugent, the greatest Shakespearean of the day, affirmed at a dinner that there was not in all Shakespeare's plays a single passage commending, directly or indirectly, the moral qualities of the dog." Thinking this to be impossible, the literary physician accepted a wager which Lord Nugent offered him on the subject with the concession of a year to make the research. Even with the aid of several friends, he failed to find any such passage; and at the end of the year Sir Henry paid the guinea which he had lost.

The writer adds that no Concordance was then in existence, or the question might have been settled in a quarter of an hour. He himself looks up the word dog, and finds that it "occurs 174 times; hound, 31; greyhound, 13; spaniel, 8; mastiff, 5; cur, 45, and a few others bring the number up to about 300. True enough, they are generally mentioned with contempt, never with commendation."

If Lord Nugent was "the greatest Shakespearean of the day" (who ever heard of him as such?), he should not have needed a concordance to find out that the dramatist loved dogs and has paid them many a tribute. See, for instance, the description of hounds by Theseus in "A Midsummer Night's Dream" (iv, i, 108-132), and the talk of the hunters about their dogs in "The Taming of the Shrew" (ind. i, 16-29), both too long for quotation here. In the "Merry Wives" (i, i, 96-104), Page defends his "fallow greyhound" against the criticisms of Slender, and Shallow takes his part. In "Macbeth" (iii, i, 92—101), when the 1st Murderer says, "We are men, my liege," Macbeth replies in substance (I need not quote the ten lines)

that there are dogs and dogs, as there are men and men, good, bad, and indifferent, but "the valued file"—the list that distinguishes them according to their natural gifts or qualities—gives to each "the particular addition" (title or denomination) he deserves; the "house-keeper" (watch dog), and "hunter" being superior to the "common cry of curs," etc. Launce's praise of his dog Crab—a poor thing but his own—the only brute beast in the plays that fairly might be counted as one of the *dramatis personæ*—could only have been written by a man who loved dogs himself. In all these passages, to say nothing of minor references to dogs in the plays and poems, Shakespeare speaks in a way for himself, as he certainly does *not* in the many contemptuous allusions to them that he puts into the mouths of his characters. It is the Christians in the play, not he, who again and again call Shylock "dog," but it is he, personally in a significant sense, that makes the Jew turn the metaphor against the Christians in "Hath a dog money?" and "Since I am a dog, beware my fangs!"

The vulgar figurative illusions to the dog are often absurd enough—like "as dank as a dog" (to which the Carrier, in "1 Henry IV," ii, 1, 9, compares the "peas and beans" in the stable), a simile which has comically bothered some of the critics, who have soberly suggested "bog" and "dock" in place of "dog." Taylor, the Water Poet, in his "Dogge of Wars," with more sense of humor, makes fun of these canine comparisons:

> Many pretty ridiculous aspersions are cast upon Dogges, so that it would make a Dogge laugh to heare and understand them. As I have heard a man say, I am as hot as a Dogge, or as cold as a Dogge, I sweate like a Dogge (when a Dogge never sweates), as drunke as a Dogge, hee swore like a Dogge, and one told a man once, that his Wife was not to be believ'd, for she would lye like a Dogge, etc.

Cambridge, June 17.

A LATER BACONIAN.

TO THE EDITOR OF THE NATION:

SIR: Mr. W. S. Booth, in his ingenious book on "Some Acrostic Signatures of Francis Bacon," gives a neat illustration of the exact character of these so-called signatures. "It is," he says, "as if a log of wood were found in the way of an express train two miles out of Boston. This might be regarded as an accident. But a similar log found in a corresponding place two miles out of every important station between Boston and New York would, by many observers, be regarded as evidence of intention." In the light of Mr. Booth's own illustration, other observers might ask: "Are these logs really on the track? or are they mere sleepers, part of the roadbed? Is not the real evidence of intention in Mr. Booth's peculiar methods for seeing peculiarities in the normal position of things? If he calls attention to one of these sleepers two miles out of every station, it is surely a harmless amusement, a sort of traveller's whist. Let each sleeper count fifty like the black cat on the doorstep, but remember a log is not really a black cat. Now we can mark and count sleepers with a certain amount of readiness ourselves."

Let us take the most popular poem in the English language, a poem probably written by Thomas Gray, called "An Elegy In a Country Churchyard." There are, it is true, suspicious circumstances about its composition, for Gray kept it in his portfolio many years before sending it to be printed. It is said he was polishing it. On the contrary, there is every evidence in the poem itself that he must have been engaged in inserting a multifarious acrostic. Why should Gray do this? In order to assign the poem to Francisco Bacono, to Francis Bacon, to Fran Bacon, to F. Bacon, to Bacon, or to Nocab. For Gray uses all these acrobatic signatures just as Mr. Booth and Bacon do, and he uses them all in a single significant stanza, a stanza of evident *double atteinte*.

The way to find this stanza is to hunt through the poem for one where the first line begins with F, and the last line begins with N. There are four lines in a stanza, and you may be able to spell Francis Bacon or any of the above mentioned aliases, by starting with the F and reading to the right on the first line, backward to the left on the second, and so on, weaving in and out through the stanza until you land pat on the N. Of course, the chances are that you will complete the name before you reach the N, for it is composed of common letters. But if so, then spell only on terminal letters of words, or else only on initial letters, and you will find that where Bacon or one of his "servants," like Gray, is at work, you can strike that N every time.

As you hunt through the poem for such a stanza, note that five stanzas begin propitiously with capital F's, but that only one of these has the last line beginning with N. The fact is significant. Rivet your attention, then, on this stanza till the full force and hidden meaning of the first and last lines sink in on you:

> For who, to dumb Forgetfulness a prey,
> This pleasing anxious being e'er resign'd,
> Left the warm precincts of the cheerful day,
> Nor cast one longing ling'ring look behind?

The first line looks suspicious. "Dumb Forgetfulness!" and a capital F in the middle of a line! Personification? Personification of Francis, then, you may be sure. The last line is even more suspicious. "Look behind!" Also remark the foot of the page of this old edition we are using. You see a detached "B," a printer's sign, and next to it the word "For," placed there to show what word begins the next page, as in so many old books. But may they not well mean something else here, this B F in capitals? this "B For"? Keep this in mind. Meanwhile observe the stanza itself.

> FoR who, to dumb forgetfulness A prey,
> This pleasing anxious being e'er resigN'd,
> Left the warm preCIncts of the cheerful day,
> NOr CAst one longing ling'ring look Behind?

First note how the letters have been RELIEFED, and then: (1) Spelling on all letters from F in For, spell FRANCIS BACON to N in Nor, by taking the next required letter as you read along the first line to the right and backward along the second line to the left, and so on.

Now, I haven't the patience to make a reliefed draft for each of the eleven acrostics in this same stanza, but they follow thus: (2) Start with the F of For, and spelling only on *initial* letters, go to the right, and spell F. BACON to that N in Nor. (3) Similarly spell FRAN BACON, using only terminal letters (the first and last letters), and weaving back and forth through the stanza thrice—thus (if you are painfully stupid and can't see it by yourself), FoR A Nor Being A Chearful One Nor—those are the words where the secret letters lie, in order; that is, where they lie in order to tell the truth. (4) Next see how NOCAB stares at you from the last line alone—Bacon often spelled his name backwards. Of course this is very convenient, but a mere bagatelle to what is coming. (5) What is the most significant phrase in the whole stanza? "Dumb Forgetfulness," without a doubt! Remember that B F which I spoke of, at the foot of the page? Clearly, a signal to the wary; for "dumb Forgetfulness" is the only place in the stanza where B and F come together. Propitious, then, for Bacon might be left to dumb forgetfulness did not the acrostic here speak for him. Start with the B of dumb (significant for being itself a silent letter), and spelling on *terminal* letters, go to the left, and spell BACON to the N of Nor. (6) Start with the B of dumb, and spelling on *terminal* letters, go to the right, and spell BACON to the N of Nor. (7) Start with the F of Forgetfulness, and spelling on *terminal* letters, go to the left, and spell F. BACON to the N of Nor. (8) Start with the F of Forgetfulness, and spelling on *terminal* letters, go to the right, and spell F. BACON to the N of Nor. Note the perfect symmetry of these last four acrostics. (9) Now start with the B of dumb, and spelling on all letters, go to the right, and spell BACONBACON, thus twice over, to the N of Nor. (10) Start with the F of Forgetfulness, and spelling on all letters, go to the right, and spell FRANCIS BACON to the N of Nor. (11) And, finally, start with the F of Forgetfulness, and spelling on all letters, go to the left, and, weaving through the stanza thrice, down and up and down again, spell FRANCISCO BACONO to the O in the key-word Nor.

Other acrostics may be read from the isolated B and F, at the foot of the page, through an intervening stanza, on initial letters of words, to the key-word. On the whole, it seems to be a more multifarious and significant acrostic than any which Mr. Booth has been able to discover in Shakespeare.

For Baconians the question now arises: Did not Bacon really write the famous Elegy?

R. A. RICE.

Cambridge, Mass., June 10.

JACKSON AT THE EXECUTION OF JOHN BROWN.

TO THE EDITOR OF THE NATION:

SIR: In your issue of May 27, referring to Mrs. Stonewall Jackson's greeting of President Taft as the "harmonizer of all our hearts," you say:

> Next to Lee, no one is more enshrined in the hearts of Southerners than the sturdy general who paraded the Virginia Military Institute Cadets at the hanging of John Brown, and later fought so magnificently from Bull Run until his death, on the field of Chancellorsville, at the age of forty.

By such readers as are accustomed to rely upon the *Nation* for uncolored state-

ments of fact, it may be inferred that Jackson took the cadets under his charge to the execution of Brown, so that they might have the opportunity of witnessing an instructive and entertaining spectacle.

According to the statement of Prof. R. L. Dabney of Union Theological Seminary, Virginia, the biographer of Jackson, the cadets of the Institute, with their officers, were ordered to Charlestown, the place of execution, to do duty in preventing the rescue of Brown, which was threatened. (Dabney: "Life and Campaigns of Lieut.-Gen. Thomas J. Jackson," pp. 143, 144).

Whether or not apprehensions of the rescue of Brown were justified, it is plain that the presence of Jackson and the cadets, coming from Lexington to a remote part of the State, was in obedience to orders, as Professor Dabney states.

R. L. TULLIS.

Baton Rouge, La., June 14.

[We were quite aware that the Institute Cadets were under orders from the State, and we meant to convey no other impression.—ED. NATION.]

FILLING OUT HISTORICAL RECORDS.

TO THE EDITOR OF THE NATION:

SIR: A paragraph in the *Nation* of February 25 called attention to the many gaps in the historical record of our country, especially of its colonization period, owing to the fact that an enormous number of original documents have never been printed. It is perhaps known to comparatively few even of the *Nation's* readers that a movement of no small importance has been lately begun for the express purpose of filling up these "gaps," and as its original impetus came from a quarter whence such inspiration is little looked for, it surely deserves brief mention.

From the time that Dr. Dunbar Rowland, director of the Mississippi Department of Archives and History, began his work in 1902, he cherished the hope of bringing the earliest records of the settlement of the Mississippi valley—records known to exist only in the archives of Europe—within the reach of historical students of his State. Having obtained in 1907 from his State Legislature an appropriation to cover the cost of transcribing such Colonial documents as he could find, this gentleman went to Europe at his own expense, investigated the great repositories in England, France, and Spain, and made arrangements for copying a large number of records bearing on the provincial history of his State. This task has since been steadily progressing. At present the series of English transcripts is completed, and includes sixteen large volumes covering the English occupation of West Florida, from 1763 to the conquest of the country by Spain in 1781. From the Paris Ministry of Colonies seven large bound volumes have been received, covering the period of 1678 to 1716, and as many more will be sent later. Of Spanish archives, the department now has thirteen volumes dealing with events beginning with the occupation of West Florida by Spain, and ending with the taking of Pensacola by Andrew Jackson. Five additional volumes will probably complete the series called for.

But these accomplished gains of the Mississippi Department are of far less importance than the results they are likely to bring about. At the meeting of the American Historical Association at Madison, Wis., December 27-31, 1907, Dr. Rowland read a paper on "The Coöperation of State Historical Societies and Departments in the Gathering of Material in Foreign Archives." The discussion of this paper led to the appointment of a committee of seven, charged with the duty of formulating a plan for the work of coöperation suggested, and of reporting it to the next annual meeting of the association. This committee met in Washington, D. C., April 16, 1908. After going over the ground, it decided that the most promising field for coöperative effort was offered by the States of the Mississippi valley, and that the richest return for work would be found in the French archives.

In offering the report of the committee's deliberations to the meeting of the American Historical Association at Richmond, in December, 1908, its chairman (Dr. Rowland) pointed out that at least fifteen States were directly interested in this historical material, a sufficient number to meet with comparative ease the great expense involved in the selection and transcribing of such material.

The recommendations of the committee were, in brief, that the historical agencies of the Mississippi valley should join in a coöperative search of the French archives, that a complete working calendar of all material there relating to the Mississippi basin should be made by a competent man sent by these agencies, this calendar to be printed and published as soon as prepared, and that the necessary money for the preparation and publication of this calendar should be raised by voluntary contributions from historical societies. To these recommendations the association fully agreed, and this important work is to be begun during the present year.

Jackson, Miss., June 15.

WILLIAM SHIRLEY.

TO THE EDITOR OF THE NATION:

SIR: As to William Shirley, Governor, and William Shirley, dramatist (differentiated by Mr. Matthews in your issue of May 27), is there any evidence at hand to show which, if either of them was the author of "The Antigonian and Bostonian Beauties; a Poem. Occasioned by seeing the Assembly, at St. John's, Antigua, on Thursday, the 7th of July, and afterwards at Boston, in King-street. By W. S., A.B.," Boston, [1754]?

This rare piece of American poetry has been accredited to one William Shirley, but this statement is undoubtedly a pure surmise on the part of some one making the initials "W. S." stand for that name. The authorship has also been seriously ascribed to the Rev. Charles Chauncy of Boston. But is it fair to suppose a sedate and orthodox New England minister to have written these amorous verses "after seeing the Assembly" of dancers in Antigua and Boston? Perhaps some bibliographer can furnish information on the point.

ALFRED B. PAGE.

Boston, June 17.

Notes.

The Index of the *Nation*, January 1 to June 30, will be printed with the issue of July 1.

A fifth, corresponding to the eighth French, edition appears of Baedeker's "Nortbern France" (imported by Scribners), in time for this season's travellers. The country included extends from Belgium and the English Channel to the Loire, with the omission of Paris and its environs, which have a separate volume to themselves.

Since 1866, when Motley finished the concluding volumes of his "United Netherlands," that work with its predecessor, "The Rise of the Dutch Republic," has maintained its place as a standard history. We are glad to see that Harper & Bros. have now issued a popular edition of the later work complete in two volumes. The type and paper are excellent.

Those who have not read G. Lowes Dickinson's Ingersoll Lecture "Is Immortality Desirable?" in the May *Atlantic* will be glad to know that it has been issued by Houghton Mifflin Co. in a separate small volume. Like all of Mr. Dickinson's work, this essay has a grace of language and a subtlety of procedure that few other writers to-day, if any, can command. But it cannot be said that the discussion carries one far or is very persuasive. It scarcely needs Mr. Dickinson's art to convince us that immortality is desirable, and to convince us that it is true he has no stronger argument than a plea to await the conclusions of the Society for Psychical Research. A few notes, in which Goethe's and Lorenzo de' Medici's names are both given wrong, are added to the text as it appeared in the magazine.

"Modern Golf," by P. A. Vaile (London: A. & C. Black), is a really original book on a now hackneyed subject. The author has brought a fresh mind and clear eye to the study of the game, and urges something like revolutionary ideas both as to teaching and practice. Many of these commend themselves as presumptively reasonable, though one would like to see them many times down in the black and white of the links before giving implicit assent. The chief innovation of the volume is the application of mechanical principles to the structure and use of clubs and the flight of the ball. Mr. Vaile's insistence that the rotation of a golf ball is as vital to the player as is the cut on a tennis ball, is certainly a fruitful conception, which he follows out with satisfactory demonstrations of the true cause of imperfect strokes and of the glory of successful ones. Even blasé golfers will find his discussions stimulating and often correcting.

"A Book of Hours," by Ellen Thompson (The Forest Press), is a posthumous volume of rambling papers on books, authors, and places. The preface informs us that the discourses here assembled were originally delivered to large audiences in Boston and vicinity, and that they were "one of the instituted charms of culture in the city." The dear-old-Charles Lamb and dear-old-England vein, in which they are written, would seem eminently suitable, we should think, in the clubroom of ladies

in quest of sweetness and light. There is no apparent reason why those who liked the spoken lectures should not enjoy them in book form.

"The People at Play," by Rollin Lynde Hartt (Houghton, Mifflin Co.), is a fairly comprehensive account of the ways in which men, women, and children of the cities with from ten to twenty-five cents in their pockets amuse themselves. There are treatises on the burlesque, the dime museum, the amusement park, the melodrama, society, the biograph-show, the "Muses in the Back Street," and baseball. The author's copious illustrations, inside the cover and out, portray the humors of popular gayety from the bill-board to the grand-stand. The spirit of the work, Mr. Hartt informs us, is that of the student of comparative ethics. From a first-hand acquaintance with the proletariat he has come to the conclusion that we (the well-washed and educated class) look too superciliously upon the recreations of the poor. When we try to refine their taste we should begin by recognizing its soundness in many essentials. The melodrama, for example, is really the "Ten Commandments in red fire." The residents in the back streets have a liking for color and vigor in the field of art; it is usually a mistake to hang a Botticelli over the kitchen sink. There are a good many suggestive hints of this character thrown out in passing; but on the whole the book does not carry a very deep philosophical keel. Its chief value lies in its record of things which few writers have thought worthy of record. It is, therefore, to be regretted that the author has steadily handled his material with kid gloves. With some apprehension addressing a very polite audience, he has sought to elevate his subject by stiltifying his style. Speaking, for instance, of the possible "passing" of the biograph, he writes, "That eventuality is not unforeseen, especially by our clairvoyant moralists, who storm the Legislature with demands for restrictions upon celluloid liberties." Such Henry Jacobean periphrasis—to parody our author—is ill-calculated to communicate to the higher classes any very intimate or quickening sense of the recreative activities of the lowly.

I. L. Nascher, M.D., certainly knows the Bowery, as it was before the sight-seeing automobile made of it a well-managed side show. Its rum-shops, opium dens, dance halls, and their blasted habitués he can call by names and by history. Nothing that is diseased, repulsive, or criminal in that region has escaped his eye. But not all thorough knowledge is scientific or useful. We see neither fairness nor clear purpose in the sub-title, "a sociological study," with which Dr. Nascher describes his book, "The Wretches of Povertyville" (Chicago: Jos. J. Lanzit). His information is useful only to the police and social workers, all of whom already possess it ten times over. For everybody else it is either revolting or viciously attractive. The "Practical Measures" suggested in the closing chapter are loosely thought out. They suggest a smattering knowledge of criminology blended with a great deal of shrewd but one-sided observation.

"The Third French Republic' (Lippincott) scarcely justifies Frederick Lawton's claim that it represents the result of a long personal experience of French life. Even under the most favorable interpretation the work never rises above ordinary journalistic standards. The author's plan involves more than a review of political history; there are several chapters on literature, science, art, education, and the Mutualist or friendly society movement. In spite of this ambitious scheme the work lacks proportion, and bears evidence of hasty writing and superficial knowledge. Superior to the rest of the book are the chapters which notice various phases of the literary movement in France. But even here Mr. Lawton's criticism is not always trustworthy, nor is his reading wide. M. Muntz is set down as an historian of Tuscany, but no mention is made of his important contributions to the study of Italian art. It is surprising also to find Lavisse's "History of France" criticised as partisan. No one who has seen the book could fail to observe that it is a series of monographs. One would like to know just what portions Mr. Lawton thinks are unsatisfactory, or whether he holds that none of the distinguished writers who contributed to Lavisse has reached his own standards of historic excellence. The chapters on the successive governments and Presidents of the third Republic contain many mistakes of detail. There is, too, a singular inability to appreciate the essential elements in French constitutional development. Little or no attention is given to the genesis, growth, and decline of various French political parties. Even the account of the composition of the French Senate is not correct. In place of reliable information on important questions there are innumerable anecdotes about public men; their epigrammatic sayings are repeated, and the book is burdened with trivial items of personal gossip. In following out his method of lumping together without discrimination, the subordinate and the main details of recent French history, Mr. Lawton manages to cover a great deal of ground, and his book does embody some useful material that might be left unnoticed by a more careful historian. But this way of writing history produces curious and unexpected results. The reader gets an account of the Charity Bazaar fire, but is left in almost complete ignorance of some important factors in the struggle between the state and the church which led up to the Separation Act.

Dr. William Elliot Griffis is a veteran bookmaker, and upon all that relates to Dutch history and institutions is an unquestioned authority. In many of his earlier writings he betrayed a strong Dutch bias, and, since the death of Douglas Campbell, has been the chief exponent of Dutch influence in American history. In his latest work ("The Story of New Netherland," Houghton Mifflin Co.) he is less concerned with the Dutch as the authors of our institutional being, and more with the effort to rescue this worthy people from the grasp of Diedrich Knickerbocker. In this task he has succeeded, and his book has value for old and young alike. He carries the subject beyond 1664, devoting nearly half his book to the later history of the Dutch in America. The defects of the work are patent: excessive stress is everywhere laid on the place of the Dutch in American life; dislike is manifested toward all things British; and ignorance of other phases of colonial history is unfortunately all too evident. To speak of the Navigation Acts as the cause of the Revolution is to ignore facts; to call life in the South before the war a "belated feudalism" is to admit an historical anachronism; to say that the Angles and Saxons were Dutch before they were English is to employ a catch-penny phrase that is meaningless to historian and philologist alike. It is a pity that so good a book is marred by these amateurish touches.

"Toujours perdrix!" exclaimed the French gourmand. "Toujours Touraine!" one is inclined to reply, as book after book on the favorite tourist section of France issues from the press. The latest, "A Summer in Touraine," by Frederic Lees (A. C. McClurg), is one of the most attractive. Mr. Lees is not a pictorial writer, and occasionally he trips up in his syntax, but he tells his story without affectation, and he strikes a fair balance between description and history. Prospective tourists, especially if they be motorists, can learn from him how to reach one château after another, and what to look for, inside and out. Then the past is conjured up, and gives that bowing acquaintance, which seems to be so much coveted with the great barons of medieval France, with royal and other mistresses, and with the modern nobility (or Parisian plutocrats) who own or occupy these historic places. The hundred illustrations are truly admirable, not excepting the dozen colored plates by Maxwell Armfield, which, with their Boutet de Monvel tints, suggest the tone in landscape and sky of the Elysium of the Loire. The book should be a delight to Tourainists on their travels, and a pleasure to dip into afterwards.

The curator of the Musée Carnavalet, *i. e.*, the man who, by profession, ought to know most about historic Paris, is just the guide intelligent tourists were looking for; nor does George Cain disappoint them. In the twenty-six chapters of this book ("Walks in Paris," translated by Alfred Allinson; the Macmillan Co.), all the spots of the city that have any association with heroes of history and romance are passed in review, so that, behind the Haussmanized Paris of to-day, we can evoke the Paris of Philippe Auguste, Charles V, Henri IV, Louis XIV, and Napoleon. The ancient and the modern mingle at will in these chatty pages, all the way from the thirteenth century down to the reign of M. Fallières. Thus one street, the narrow rue Visconti, on the left bank, brings back to memory the duels of the Pré aux Clercs, the meetings of the persecuted Huguenots, the sojourn of Racine, the death of Adrienne Lecouvreur, the brilliant career of the actress Clairon, the unfortunate printing house of Balzac, and the abode of one of the numerous men who attempted to kill Louis-Philippe. All streets are not so rich in historical associations. But be it the Rue de Sèvres with its Abbaye-aux-Bois graced by Mme. Récamier, the mysterious and quiet streets around St. Sulpice, the romantic Place des Vosges, the Boulevard du Temple, the Bastille, or the Place Vendôme, there does not seem to be a commonplace-looking thoroughfare, crossed a hundred times a day by indifferent feet, that may not evoke some dramatic incident of history, or have some association with a man

of letters. M. Cain knows the Paris of to-day as well as the Paris of former times, and tourists who are accused of seeking in Paris resorts that they would dare visit in their own country will take delight in following their guide in the rue des Innocents and around the rue Maubert and the Halles, where cutthroats and "Apaches" hold their headquarters. The value of the book is enhanced by ten maps and plans of old Paris, and by more than a hundred well-chosen pictures. The translator was obviously interested in his translation and tries to supplement in his notes the information of the text.

Prof. Lawrence H. Mills, the eminent Zend scholar of the University of Oxford, is about to issue, in his seventy-third year, a continuation of the study of the Avesta Yasna, which he began nearly two decades ago in his monumental edition of the Gathas, the earliest portion of the Yasna. This work is now practically in the binder's hands. It will contain not only a reconstructional edition of the Avesta text with copious notes, but also the Pahlavi or Middle Persian commentary (both in the original character and in transliteration) with full translation, the Sanskrit version of Neryosangh newly collated from five manuscripts and translated for the first time, and a Parsi-Persian version already used in part by Professor Mills in his edition of the Gathas. There will also be an appendix containing the accented Sanskrit equivalent of the Avesta text, as well as four photographic plates of Avesta, Pahlavi, and Sanskrit manuscripts, and other illustrative material. The work will maintain the same high standard as that set by the same editor's Gathas, which has long been out of print and of which a reissue is urgently needed. Professor Mills is also continuing his work on the "Dictionary of the Gathic Language," of which 120 pages will soon be issued; and a number of his lectures at Oxford have recently been translated into Italian by a Turin barrister, their appearance in print being promised in the near future.

The Papal Commissione per la Revisione della Volgata has recently published a report of the present status and purposes of their work, the document appearing in several languages, issued by the Tipographia Pontificia dell' Instituto Pio IX. In this official utterance the Catholic savants in charge of the work state explicitly that "the business of the commission is merely to restore the text of Jerome in a critical way, that it is not to prepare a new text, and that the testing of Jerome's text as to its correctness will be left to another commission to be appointed at a later time." The work is to be done in the International St. Anselmo College of the Benedictines on the Aventine in Rome. Of this building the report gives two fine pictures, to which are added a number of other illustrations, chiefly of manuscripts. Fifteen collaborators are at work in different countries examining the Vulgate manuscripts, and a catalogue of all of the European documents on the Jerome version is in preparation. It is estimated that the cost of the work will be about 25,000 francs per annum, and that from eight to ten years will see its completion. The commission believes that the 250,000 francs needed should be readily given by Catholics and the *primus clenchus contribuentium* is headed by the Holy Father himself with a subscription of 12,000 francs. So far the total subscriptions have been 44,900 francs and the expenses 20,000. The report is unfortunately not free from vexatious errata.

The approaching quater-centennial of Calvin's birth, which is to be celebrated in Geneva on July 10 with academic and ecclesiastical impressiveness, has led the professor of ecclesiastical history at the University of Berne, Dr. Fritz Barth, to a reconsideration of the famous Servetus case. The outcome of these studies, which has just appeared under the title "Calvin und Servet" (A. Francke, Berne), is a pamphlet of more than ordinary interest. It presents minutely the events and transactions which brought about the arrest and trial of the daring free-thinker, who had deserved a better fate than being put to death by the man who should have been his protector. Professor Barth shows conclusively that Calvin sacrificed Servetus for reasons of state. Calvin's own faith in the doctrine of Trinity had openly been called in question by the French theologian Caroli. Melancthon, Capito, and other leaders of German Protestantism had expressed alarm at his free utterances concerning the Nicæan creed. The council of the city of Berne had made protestations on that subject to the Genevese government. It seemed a matter of high political importance that the Calvinistic wing of the Reformed Church should declare in no uncertain sounds its solidarity with the other adherents of organized Protestantism in upholding the one fundamental doctrine in which there was no dividing line between the Protestant and the Catholic Churches. This could be accomplished by making a scapegoat of an indiscreet enthusiast and ardent radical like Servetus. And not for a moment did Calvin shrink from improving this opportunity, even though doing so implied the violation of the most fundamental laws of honorable conduct. This thesis Professor Barth states with great lucidity.

Unaffected and simple in style—reminding one at times of Frenssen's "Peter Moor"—and very sincere and touching in sentiment are the autobiographic records of a trained nurse given in "Dornenpfade der Barmherzigkeit: Aus Schwester Gerda's Tagebuch," edited by Sister Henriette Arendt, a well-known nurse of Berlin, and published at Stuttgart by the Deutsch Verlags-Anstalt. The difference is, however, that while "Peter Moor" may be only realistic fiction, based on fact, these leaves from a nurse's diary were actually written by a young woman, who had no thought of ever printing them. The object in now giving them to the public is merely to warn many from entering on a difficult career, and to arouse those who, directly or indirectly, are responsible for much of the experience of the average overworked and unappreciated nurse. That the book will affect most readers there is little doubt, for it is largely a series of shadow pictures of depressing realism. Nor are the incidents German or local for the most part, but probably such as may happen any day in any large city of the New World. Even the absence of literary touch in parts of the volume, due to the youth of the writer or the conditions of the midnight watch when, beside some dying patient, the notes were jotted down, adds to the force of this tragedy of a humble life.

The "Tagebuch des Grafen P.-L. Röderer," minister and councillor under Napoleon, by Gen. von Pfaff (Berlin: Karl Sigismund), is a work, whose interest is much increased by a compendious introduction and notes from French archives by Maurice Vitrac. Perhaps the chief value of this work is that it brings forth new matter, of a gossipy value, from private diaries.

The "Grundfragen der Homerkritik," by Paul Cauer, which has been brought out in a second edition by S. Hirzel of Leipzig, has been so entirely changed and enlarged that it is practically a new work. It discusses critically all the Homeric problems of the times under the three heads of Textkritik und Sprachwissenschaft, Zur Analyse des Inhalts, and Der Dichter und sein Werk.

Dana Estes, publisher, traveller, and writer of note, died suddenly in Brookline, Mass., on Wednesday of last week, at the age of sixty-nine. He was born in Gorham, Me. In 1859 he went to Boston and entered the book trade. At the outbreak of the civil war Mr. Estes enlisted in the Union army, and served until the second battle of Bull Run, where he was wounded three times. Being disabled for further service, he returned to Boston and reëntered the book business. He was a member of various firms until 1898, when he organized the house of Dana Estes & Co. Only a few months ago Mr. Estes returned from a trip through the African jungle now being traversed by Mr. Roosevelt. He was the first American to penetrate the Nile country to Uganda and the Congo State. He was a member of the Bostonian Society, the American Association for the Advancement of Science, and other societies. He organized the International Copyright Association and was its first secretary.

Prof. Frederick de Martens, formerly professor of international law in the University of St. Petersburg, a permanent member of the Council of the Ministry of Foreign Affairs, and one of the most distinguished jurists of his day, died on Sunday of this week. Professor de Martens was born in the Russian Baltic provinces in 1845. He studied law at the Universities of St. Petersburg, Vienna, Heidelberg, and Leipzig. He was attached to the person of the chancellor of the Russian Empire, Prince Gortchakoff, for special missions in 1876. The diplomatic congresses which he attended as Russia's representative included important gatherings at Brussels, Paris, The Hague, Geneva, and Vienna. He is known best to the American public, perhaps, through having served as one of the Russian delegates at the peace negotiations between Russia and Japan in this country in 1905. He was also prominent in the public mind here through serving at the peace conferences of The Hague. At the conference of 1899 he was the second Russian plenipotentiary, and he was chosen president of the Second Commission. Since 1874 he had been selected several times by European and American Powers as an international arbitrator. He was president of the Court of Arbitration in Paris in 1899 which considered the differences between Great Britain and Venezuela. He also served as arbitra-

tor between France and England; England and Holland, and the United States and Mexico. When he died he was a member of the Permanent International Court of Arbitration at The Hague. In 1906 he represented his country at the Geneva Conference for the revision of the Geneva Convention of 1867. He attended the Peace Conference at The Hague in 1907 for the third time. He wrote many books. One, "De Martens on International Law," has been translated into German, French, Spanish, Japanese, Persian, Servian, and other languages. Other works are: "La paix et la guerre," "On Consular Jurisdiction in the East," "Recueil des traités et conventions conclus par la Russie avec les Puissances étrangères," and "Le Conflit entre la Russie et la Chine."

BRÜCKNER'S RUSSIAN LITERATURE.

A Literary History of Russia. By A. Brückner, Professor of Slavonic Languages and Literature in the University of Berlin. Edited by Ellis H. Minns; translated by H. Havelock. New York: Imported by Charles Scribner's Sons. $4

This volume is beyond all question the best—and the most unreadable—account of Russian literature accessible in English. Of former attempts, that of Miss Hapgood is a primer, compiled from Russian critical authorities; that of Waliszewski is a light, hasty sketch, clever and superficial; that of Kropotkin, though full of excellent criticism, is rather a panegyric on the liberation movement, as expressed in Russian writers, than a treatment of the national literature in all its aspects. Professor Brückner has a wider acquaintance with his subject, and a more catholic sympathy, than any of his predecessors. His point of view is that of a professional student of literature. Though he does not strive for an impossible freedom from personal bias, his own political views never blind him to the merits of writers who belong to opposite parties.

Unfortunately, this valuable work is clothed in a style that will frighten away any but determined students of literature. In German, though at times he rises to a sombre eloquence, Professor Brückner usually writes in lumbering, involved, often obscure sentences, sometimes marred by Polonisms. To these sentences Mr. Havelock usually adheres with bulldog tenacity, producing a result that is tenfold worse than the original. An English reader can hardly expect a translation from contorted German periods to be light and graceful; he may, however, demand a plain, straightforward, idiomatic rendering that shall not continually distract his attention from the subject of which it treats. Instead of this, Mr. Havelock gives us uncouth diction like the following:

> The most respectable performances still remain those of Tolstóy, Count Alexêy of the name, the youthful playmate of Alexander II, subsequently for many years Master of the Hunt—sport was his ruling passion—grew up from his early youth among impressions, of beautiful scenery in Little Russia, of Art during Italian journeys—with the inevitable visit to Weimar and Goethe, whose majestic language impressed the boy—of literature, a love for and cultivation of which he found among his nearest relatives, into an admirer of Pushkin, and a contemner of modern didactic literature (p. 493). [The misprint of a comma instead of a period after Tolstóy has made a bad matter much worse.]

On the other hand, absolute errors in translation are infrequent. The versions from Russian poets, which have been made by Mr. Minns directly from the Russian, are accurate and simple, though of small literary merit. The index is careless and unsatisfactory.

Of early Russian literature Professor Brückner gives but the briefest sketch (89 out of 545 pages), beginning his fuller treatment with the reign of Catherine the Great. One may regret this choice, and still more his neglect of the remarkable folk-lore of Russia. Most readers would gladly sacrifice many pages of discussion of minor writers of the eighteenth, and even of the nineteenth century, in exchange for an ampler account of the early chronicles, of the apocryphal legends, of the "Tale of the Raid of Igor," and, above all, of the Russian popular ballads. As a Pole, Professor Brückner may be prejudiced against Russian mediæval culture, dominated as it is by Eastern Orthodoxy. Be this as it may, he has acted with his eyes open, deliberately sacrificing the earlier periods in order to give a more adequate account of the origin and development of modern Russian literature. He must be judged by his success in carrying out his own plan, the reasons for which he well states in his opening paragraph:

> The history of Russian literature must claim full attention in a special degree. Not by its age, for it is the youngest of the great literatures; not by its perfection, for it often foregoes æsthetic effects; but certainly by its peculiar character, the high humanity of its content, its naturalness and sincerity, its soaring idealism, the depth and pathos of its effects, and lastly, the significance it claims in the mental life of the nation. To Englishmen or Frenchmen, Germans or Italians, polite literature is only one form for the expression of national feeling and thought: to the intelligent Russian, without a free press, without the liberty of assembly, without the right to free expression of opinion, literature became the last refuge of his freedom of thought, the only means of propagating higher ideas. He expected and demanded of his country's literature not merely æsthetic recreation: he placed it at the service of everything noble and good, of his aspirations, of the enlightening and emancipation of the spirit. Hence the striking partiality, nay unfairness, displayed by the Russians towards the most perfect works of their own literature where they did not answer to the aims or the expectations of their party or their day. A purely æsthetic handling of the subject would not gain it full acceptance.

Accordingly, Professor Brückner adopts primarily the sociological point of view. He makes us understand the great controversy between the Slavophiles and the Westerners, so important for any proper appreciation of the novels of Dostoévsky and Turgénev. He gives an idea, somewhat fragmentary, to be sure, of the radical and materialistic movement of the sixties, and notes the part played in it by different writers. He shows how Ostrovsky's dramas form a protest against the ignorance and brutality of the Russian merchant class, displaying, in Dobrolúbov's phrase, a veritable "kingdom of darkness." He explains how the "poets of pure art," Máikov, Tyutchev, and others, were valued only by a small number of expert judges, while the bitterness and indignation of Nekrásov's verse-pamphlets made him the idol of all young men. In this way the author makes his literary history a running commentary on the social aspirations and speculations of the Russian educated public.

Yet, unlike many Russian critics, Professor Brückner does not allow himself to be dominated by one method of attack. He is careful to give an estimate of the merits of each writer as an artist, and to make us feel at every step that Russian literature is a part of European literature, and follows the same general course of development. He is perhaps at his best in his general criticism of periods or movements, such as this of the romantic poets:

> Whoever, leaving the exotic and mystical blooms of German, French, and English romanticism, approaches the Russian, remains disappointed. The longing for the *fleur bleue*, the fantastic ride into wonderland, allegories heavy with meaning, pantheistic or social dreams, mystical transports, are all essentially alien to Russian literature as to the Russian temperament. Both are by nature very sober, clinging to the clod of reality, and do not roam among the stars. Sound sense—how rich Pushkin was in it!—a mind tinged with skepticism, for the Russian only laughs at German enthusiasm and exaggeration; a very moderate feeling for nature, for only men interest the Russian—his landscapes are much too lacking in variety and charm; a direct aversion for abstractions, for hitherto Russia has produced no noteworthy philosopher, though it has theologians and moralists. Such conditions, I say, are most unfavorable to the flourishing of flowers of romance. How soon Pushkin came to his senses, how few Russian poems there are that move in the flaunting garb of romanticism, with all its lilies and stars! At this day we see that the re-birth of poetry, symbolical, dependent, or philosophical, is in Russia a most difficult matter, and reaps rather cheap ridicule than serious consideration (p. 211).

Yet here the author, in giving an excellent verdict upon Russian poetry, betrays himself into too broad a generalization upon Russian literature as a whole. His own analysis (pp. 423, 424) of Chernyshévsky's novel (or, to use Brückner's word, his *phantasia*), "What Is to Be Done?" which had more influence than any other one book upon young Russians of the sixties, proves that he realizes that "social dreams" are by no means absent from Russian literature. Indeed, utopian speculation is almost as characteristic of the Russian temperament as is realistic satire. To explain why it has never found expression in Russian poetry is a problem that, though in itself not difficult, has unfortunately not attracted Professor Brückner's attention.

The critic's æsthetic judgments, though not specially individual or penetrating, are nearly always sound and judicious. His general estimate of Pushkin, for example, is the best with which the present writer is acquainted:

> Pushkin founded a school; even in the older writers, who were once his teachers, one sees his influence. It is essentially one of form; not wealth of ideas, but the mastery of "Pushkin's verse," which has become simply an æsthetic definition, is aimed at, mostly to no purpose, by his successors. The indescribable music of verse, its full sensuousness, plasticity, too, with nothing blurred or indistinct, are coupled with genuine and deep feeling, sincere melancholy, and lively whims; if he lacks the passionate glow of love as of hate, yet in his creations he always achieves that balance which he so painfully missed in life. He gives quite the impression of a classical poet, and especially in his later work one forgets his romantic antecedents, and throughout it is the perfection of his form which begets these illusions. It seems to us a natural expression, as if it had been born with the matter or the idea; but behind the apparent ease and absence of effort lurks conscientious, untiring work, polishing and shaping, above all shortening and compressing of the diction, which now drapes the body like a heavy rustling dress of state, now floats about like a loose wrapping (p. 206).

In his opinions on the great Russian novelists Professor Brückner will not always command the assent of Anglo-Saxon readers, brought up in a world of commerce and industry, with its emphasis on the strenuous life. The average American reader of Russian fiction will heartily applaud his praises of Tolstoy's artistic genius; but may demur, whether justly or no need not be argued here, at his description of the great novelist as "physical and moral strength incarnate." Reading further, he will be inclined to vigorous protest when he finds that the critic reserves his most glowing enthusiasm for the diseased, epileptic Dostoévsky. After a comprehensive analysis of that writer's work, he concludes:

> As long as metaphysical questions—questions of good and evil or of the darker side of the human spirit—are raised, so long will Dostoévsky be read. He is one of the few in the world's literature who can never be forgotten: he leaves behind him the profoundest impressions, which can never be effaced, and he stirs the innermost fibres of our spirit. . . . Perhaps there are in the world's literature figures of greater talent, or, rather, more repute; a warmer, more feeling heart there certainly never was. Not in "Faust," but rather in "Crime and Punishment," does the "whole woe of mankind" take hold of us (p. 416).

The critic is right only if sentiment, Chauvinism, and pathological psychology are the sole—or the most essential—materials of a novelist's art.

Of minor defects in Professor Brückner's work nothing need be said here. Professor Veselovsky, in a review of the German edition (*Archiv für Slavische Philologie*, xxviii, 128), has pointed out various errors in matters of fact, none of which will trouble the general reader. The book as a whole may be recommended almost without reserve as the one thorough, comprehensive, and scholarly account of Russian literature in any of the languages of Western Europe.

CURRENT FICTION.

The Planter. By Herman Whitaker. New York: Harper & Bros.

There are moments in the reading of this powerful story of the rubber industry in Mexico, when, like the Abolitionists who demanded "free sugar" of their grocers, one is tempted to forswear forever the use of any article made of rubber. No tale of ante-bellum slavery days could disclose greater horrors than this narrative of tropical labor, contemporaneous, we may suppose from its allusions. The worst treated slaves of the darkest South endured no more cruelty than that here shown as visited upon the contract laborers of Mexico.

The masters varied in their ways of meeting the situation. Thus the American Ewing took his wife with him, established a domestic hearth, and treated his riff-raff laborers as well as he could. The Englishman fell into the usages of the country as he found them, and did his small-souled best from that point of view. The Austrian Jew added to the highly available, ready-made bad, something that was still worse, in the shape of devilish inventions of his own. To this group of planter neighbors is added, presently, David Mann, a Maine boy, with Puritan ideals and the aspirations of a reformer. From a narrowly orthodox mother and a successful lumberman father he derives the qualities that make him a good fighter for his own morals and for his people's improvement—a young David against Goliaths of rascal rubber companies at home and barbarities on the plantations. The story leads him through terrible predicaments, though not unaided by friendly sympathy from his American neighbors and from the best Mexican attitude, personified in a charming girl. She shares his longings to secure freedom for his slaves and justice for all his workers, whether jail scourings or captive Indians. The book ends with the beginning of a better day for masters and servants up and down the river.

The spell of the tropics, the feel of the jungle, the pride of the planter, the problems of race, have an eloquent showing. One must accept the Roman in a story of Rome. Otherwise it would be easy to object not only to the luxuriant length of the novel—five hundred and thirty-odd pages—but to excess of tropical epithet and description, and of the tropically explicit. The characters are defined with more than usual force. It is unquestionably a book of great power, stamping in its sharp-bitten impressions with mighty blows.

Marriage à La Mode. By Mrs. Humphry Ward. New York: Doubleday, Page & Co.

A book dealing indignantly with the untoward possibilities of American divorce is not what we should have expected from Mrs. Ward. We have so long been accustomed to receive from her some treatment of what might be called the grandinsular theme—the great world of little England—that it is surprising at first thought to find her concerning herself with our relatively trifling affairs. But we are presently reassured by the discovery that the paramount consideration is still the same. She inveighs against American divorce, not as a mere transatlantic monster which the world may behold preying upon the misguided inhabitants of that part of the globe, but as a foe which (thanks to the now prevalent habit of international marriages) threatens the peace and integrity of the British fireside. There is a note of panic, consequently, in her performance. She is afraid: no wonder her voice reaches an unaccustomed pitch; no wonder the horrid instance she cites is a bit strained. The disconcerting thing to the American reader is that she apparently regards her Daphne as in some sense typical of our womankind. Poor Daphne has great wealth, much physical charm, and an immeasurable egoism. Her accomplishments are hollow, her connoisseurship a sham, her manners a game which she is able to play while things go to please her. But she is capable of browbeating a husband, riding roughshod over the sensibilities of a mother-in-law, and, if you please, outbidding a duchess to her face for the possession of a costly knick-knack.

The young Englishman whose fireside she blasts is not unduly idealized by his

creator. "Roger Barnes's good looks had been from his childhood upward the distinguishing and remarkable feature about him." He has, besides, good blood, good breeding, and good humor to recommend him. He has been reared under the advantages of a seeming-solid English wealth which has unexpectedly vanished, shortly before we begin to hear about him, with the death of his father. His mother, who believes in the divine right of the British elect to inherit the earth, presently dispatches him to America "to make," as he ingenuously puts it, "some friends over here who might be useful to me. . . . In this country there are always openings—things turning up—chances—you can't get at home." He seems really innocent as to the purpose of his mission, and, after some delay, the mother is constrained to put the fact in black and white: he is to marry some rich American. That is his chance, the only chance, indeed, really open to a person of his kind of distinction. He does not like the notion, but he does not loathe it, and when the rich American presents herself, he loses no time in securing her.

After a somewhat prolonged honeymoon abroad, they wing homeward at last to the ancestral domain of the Barneses, or, rather, of the Trescoes, for "Heston Park" has belonged to the family of Lady Barnes. There Daphne, by virtue of her wealth and habit of power, at once takes command. She makes matters very disagreeable for her sufficiently disagreeable mother-in-law, her husband, and various friends of theirs —especially a former and unconfessed flame of the handsome Roger. This person is a siren of vulgar motive, but always mindful of the laws of her caste: it is Daphne who makes herself out a bounder, or its feminine equivalent. Hence the divorce, and the ensuing calamities.

The story has its striking episodes: the opening scene at Mount Vernon, the closing scene on the Isle of Wight. As a whole, it lacks poise and dignity. It is not quite amiable, its note of perturbation, of grievance, is too plainly audible. In Gen. Hobson, Roger's uncle, Mrs. Ward holds up the irascible Britisher for our amusement, and the Admirable Crichton of the story is an American officer. Nevertheless, the picture as a whole falls short of good humor. We must hope that the Canadian story, which is promised as the second fruit of her recent journey westward, will inspire in Mrs. Ward a gentler and juster strain of interpretation.

A Year Out of Life. By Mary E. Waller. New York: D. Appleton & Co.

From the author of "The Wood-Carver of 'Lympus" one looks, and not in vain, for originality of plan and grace of manner; for a deep-reaching insight equally into the constancies and vagaries of human nature, which makes at times for vagueness; and for a steadfast faith in the beneficence of the "something not ourselves." In portraying the encounter of girl-nature with man-nature, of emotional fastidiousness with the unconscious involuntary passion for converting experience into success, the author plays on so many strings that the reader is left pondering over the indeterminateness—not of the story, for that ends conclusively—but of the ways and motives of life itself.

An American girl living in Germany enters into correspondence with a German novel-writer in relation to making translations of his books. She falls greatly in love with his letters, and somewhat less in love with the man himself later on. Naturally, she does not at once discriminate between the two sentiments. He, on the other hand, is compact of German sentiment and German practicality, and contrives to be fascinating, insistent, brusque, tender, and cruel, each at the moment best calculated to torment a girl's feelings. There is no tragedy, but there is a palpable ache. Your true novel-lover will almost regret the triumph of wisdom over sentiment as he reads on, fancying that he is about to slide along the well-worn ways of "The First Violin" into a cheerful international alliance.

The Origins of the British Colonial System, 1578-1660. By George Louis Beer. New York: The Macmillan Co. $3 net.

In 1893, Mr. Beer, then of Columbia University, published as his doctor's thesis an essay of one hundred and fifty pages on the commercial policy of England toward the American colonies. This essay, though brief and in many ways inadequate, was then and is now the only study in existence of this important phase of colonial history, if we leave out of account such works as Macpherson's "Annals of Commerce." Aware of the incompleteness of his former treatment, Mr. Beer has now returned to the subject, and after spending two years among the documents in English archives has begun the issue of a series of volumes dealing with the period from 1578 to 1765. The first volume, really the last of the series, since it concerns British policy from 1754 to 1765, appeared in 1907, and now the second volume, which is really the first, treating the origins of British policy, is before us.

In method Mr. Beer's work leaves little to be desired. His research has been exhaustive, his point of view is that of the scientific historian, his grasp of the larger aspects of world-history is firm and comprehensive. He sees the colonies as factors in the growth and expansion of the British empire, and he approaches them from the standpoint of the past. He makes it clear that the origins of British colonial policy are to be sought in the customs and practices of mediæval life, and that it was a composite of principles and methods that were partly feudal and partly commercial—representative of the fief, the staple, and the monopolistic trading company. In forming her policy England invented nothing new. She took from what she had and applied the old ideas to new conditions. She was obliged to face the competition of other growing monarchies in the seventeenth century, and viewed her colonies as aids to that end. She kept them entirely within her control, since it would have been contrary to her interest to permit her strength to be weakened by the emigration of men who would set up communities of their own and trade with whomsoever they pleased. England had no surplus population; she promoted the founding of colonies in order to obtain products which could not be supplied at home and for which she had been obliged to pay foreign and competing countries in coin. The decay of foreign trade made it necessary to find new sources of supply under the flag. To have allowed these supplies to be diverted to other countries would have aided her rivals and defeated her purpose in encouraging colonial settlement.

From 1578 to 1660 the English government was engaged in defining her attitude toward colonial trade. England endeavored to restrict this trade to herself, to exclude foreigners from any commercial relations with her possessions, and to confine the carrying trade to British and colonial vessels. That the colonies might supply her with everything that she needed, she sought to induce them to produce those staples that she could not raise at home—spices, corn, wine, silk, cotton, salt, flax, hemp, indigo, wood, madder, pitch, tar, turpentine, and the like; and the persistent refusal of the colonists to do so is one of the most striking features of our early history. The southern colonies at first would raise nothing but tobacco, while the northern colonies spent no time on silk and spices, and little time on naval stores. In truth, as Mr. Beer most admirably shows, it was tobacco that shaped England's policy before 1640. There was something grimly ironical in this fact, since tobacco was deemed by the Englishman of that day an obnoxious weed, and colonies "built wholly on smoke" were as little desired then as would be colonies today whose output was only opium.

Mr. Beer also proves that all the chief features of the later navigation acts were in full operation under the early Stuarts, although not embodied in statutory form. This conclusion has never been demonstrated before, and is the most important contribution made in

this volume. He further shows that the policy of restriction was accompanied by a policy of colonial favoritism, in that the production of tobacco was forbidden in England, and the importation of the tobacco of Spanish America was limited by means of a heavier customs duty than that on the tobacco from Virginia and Maryland. It was manifestly to England's interest to do all that she could to encourage the colonies and to build up their trade. If the colonies were restricted to the English market, they at least enjoyed a monopoly of that market, and so were assured an opportunity to sell their staple products. These were the main purposes that England set before herself in shaping her relations with the colonies, and these purposes underwent few changes in later years. Unfortunately, this policy took no account of the possible development of the colonies in the direction of greater independence in their economic needs and interests.

Mr. Beer's style lacks grace and charm of presentation, and his treatment is rendered heavy by excessive detail and by a lack of clearness of exposition. His book would have been more readable if he had introduced more summaries and generalizations to show the bearing of his facts and statistics. He has, however, performed a very important work, and future volumes will be awaited with interest.

The Empire of the East: A Simple Account of Japan as It Was, Is, and Will Be. With nineteen illustrations. By H. B. Montgomery. Chicago: A. C. McClurg & Co. $2.50 net.

Drugging a Nation: The Story of China and the Opium Curse. By Samuel Merwin. New York: Fleming H. Revell Co. $1 net.

Sidelights on Chinese Life. By the Rev. J. MacGowan. With twelve illustrations in color, by Montague Smith. Philadelphia: J. B. Lippincott Co. $3.75 net.

Letters from China. With particular reference to the Empress Dowager and the Women of China. By Sarah P. Conger. Chicago: A. C. McClurg Co. $2.75 net.

The present crop of books on Japan falls far short of the average of other years, but this, Mr. Montgomery seems to think, is of advantage in understanding the country and people. Too many hasty visitors and perfunctory penmen have looked only on the outside. He has set out to tell the story from the inside, giving little attention to politics or statistics. He deals rather with ethics, art, religion, the Constitution, the home life of the people, the army and navy, and the financial position of the country, with glances at literature and the drama. We miss, however, the firmness of touch and accuracy of perspective belonging to the long resident. He persists in calling the Ainu "Ainos," thus perpetrating a double solecism. The Japanese term of contempt, "Aino," suggests semi-bestial origins, and to give an English plural to a Japanese word is undesirable. Furthermore, his subjective notions about the sure outcome of the native and foreign scholarship of the last decade or two darken rather than illuminate the subject. He shows very clearly that he has not mastered the results of the archæology and philology of Munro or Batchelor. The general style of the work is commonplace, and it cannot be said that Mr. Montgomery has added greatly to our knowledge of the people or country. Nevertheless, we have here the clear impressions of a keen observer and straightforward narrator, and the text shows warmth of heart and an honest sympathy with an aspiring people. The illustrations, both in taste and execution, are unusually fine, being, as a rule, by native artists, or copied from their prints. The concluding two chapters make a bold, if not rash, forecast of the future. He thinks "the world is destined to see a nation, not only morally, but mentally, great." The coming Japan will have "a pronounced, a well-defined character, and an intellectual greatness superior to that of ancient Greece and Rome, because restrained and illumined by the predominance and potency of moral characteristics which those great nations did not possess."

An unusually frank statement of facts, made after a searching investigation into both the literature of the subject and actual conditions in China, may be found in the book of Mr. Merwin, a journalist who went to China to study the subject of opium in all its relations to the human consumer. His pages furnish vivid pictures of the steady deterioration of Chinese physique and British morality. He gives all the information needed to show that the Chinese are sincere in their desire to get rid of what they believe to be a curse. The recent negative results, if not positive failure, of the international opium conference furnish a startling commentary upon the author's predictions. He discriminates between the aroused moral sentiments of Great Britain's people, and the diplomatic adroitness of budget-makers in London. "The British government is yielding to a tremendous popular clamor at home, but nothing more."

If the Rev. J. MacGowan be kin or descendant of the Rev. Dr. David J. MacGowan, who, a generation ago, furnished us with so many delightful titbits of information concerning nature and life in China, then this author has come well into his inheritance. He has drawn lively pictures of the Chinese way of thinking, working, dressing, eating, and playing. Evidently, it is the average man, rather than the scholar, whom he describes as having a turbid mind, as given over to oblique methods, having no love of truth in the abstract, and as being in general a bundle of contradictions. Nevertheless, all alien judgments must be taken with generous reservation. Throughout, the tone of criticism, verging at times on the cynical, prevails over the sympathetic and truly interpretative. The author spares no realism in his description of Chinese houses and city streets, and in his judgments of the wife, who, "after a few weeks of married life, loses the trim, neat appearance she had as a young girl. She drops naturally into the slattern ways of the women who are her neighbors." In spite of the absence of soap and bathtubs, the Chinese are a laughter-loving race, fond of jokes, and too gay to grieve over poverty. His chapter on Shady Professions in Chinese Life is decidedly amusing. He describes the story-teller, popularly called the Narrator of Ancient Things, who is the historian of the common people, supplying the place of books and libraries. The story-teller is also responsible for firing the blood and heating the passions of the mob, by picturing the great deeds of the past. Another chapter, on the Seamy Side of Chinese Life, furnishes the clearest argument we have yet seen against the use of opium. He shows that there is no such thing as temperance in opium, as there is in the use of intoxicating liquors, for after six months of indulgence, the devotee can no longer call his life his own. He cannot let a single day pass without taking the amount of opium smoke necessary to relieve his agony of oppression. There are a dozen handsome illustrations in color, rich and striking, but there is no index.

Not least in the literature relating to the Far East is the contribution of women in recent years. Fully as valuable as Mrs. Fraser's "Letters from Japan" are Mrs. Conger's "Letters from China." They take us into the Chinese court, showing how Manchu and Chinese ladies of high rank think and feel. Mrs. Conger not only enjoyed many a private conversation with the Empress Dowager and secured the painting of her picture by Miss Carl, but she also had the Manchu princesses and Chinese ladies of rank in her home and at her table as unhurried guests. Rigidly observing Chinese etiquette in all its imperative forms, she was all the more able to win concessions along lines where advance was possible. Once out of their bigotry and reserve, these genuine daughters of Eve showed a real and a winsome humanity. One feels that, judged by her own standards of light and knowledge, the late Empress Dowager was another Queen Elizabeth in her devotion to what she believed to

be the good of her people. Certainly, the vulgar notions and most foreign representations of this forceful woman are caricatures. Mrs. Conger arrived in Peking in 1898, and remained seven years. Her narrative of the Boxer outbreak and of life within the legation grounds during the siege is clear and vigorous; her richly illustrated and well-indexed book is vivid and fascinating, and as a whole is likely to hold its own as a permanent contribution to our knowledge, not only of China, but of the less known half of it, the Chinese woman.

England and the English from the American Point of View. By Price Collier. New York: Charles Scribner's Sons. $1.50 net.

It would be rather hard to write on such a topic as Mr. Collier's out of reasonably full knowledge, and be uninteresting—unless, indeed, one should attempt thoroughness and get too painstaking, or else dip too deeply into philosophy. Mr. Collier evidently knows his England pretty well, and he has not tried either to be encyclopædic or to produce a rival to Emerson's "English Traits." He is, moreover, decidedly contemporaneous. His historical excursions are too brief, and too superficial, to affect the quality of his book. The England he discusses is the England one will find if one goes across this summer. Most Americans should therefore find the book rather readable—and not less so because it has no particular distinction or profundity.

To Mr. Collier's general view of the state and prospects of English civilization the German terror gives considerable interest. The military and naval situation is one of the things he does not treat. But on the broad question of England's rivalry and competition with other modern nations he does give his opinion, and so pointedly that it commands more attention than anything else in the book. This, for instance, is rather strong language:

> Personally, I believe we stand at the parting of the ways, and that the student of England and the English is looking on to-day at the first indications of the decay of, in many respects, the greatest Empire the world has ever seen. The sun that never sets is setting. Nothing but a tremendous, almost miraculous, wrench can turn our stout, red-cheeked, honest, sport-loving John Bull away from his habits of centuries, to compete with his virile body against the nervous intelligence of a scientific age. . . . Though one may praise, and praise honestly, the game he has played, and the manly way, upon the whole, he has played it, this need not interfere in the least with the conviction that he is being caught up with—which means, of course, ere long left behind—in the far more scientific game that Germany, Japan, and America are playing.

Mr. Collier probably does not believe, as one might infer he does, that the English have nothing but stout bodies to oppose to the intelligence of other peoples. Here, as throughout the book, his phrasing is far from happy, and he indulges in great looseness of expression. In a whole chapter given over to the query, "Are the English dull?" he finds it at least debatable. His theory would seem to be, not precisely that the English are falling behind from sheer lack of intelligence, but that their pronounced racial characteristics and tendencies, which have enabled them to hold their own so well in past competitions, do not meet the demands of the competition they are facing to-day. It is hardly a new reflection; but we do not remember to have seen it advanced by any other writer quite so confidently as by this one.

It is not, however, the main contention of the book. In fact, there is no main contention. It is merely observation and criticism, various in tone and topic, but bringing out rather clearly an impression of England and the English as a whole, a mass. There is less of gossip and anecdote than one expects. The specific instance is usually lacking, and there is much carelessness in statement. But we think the general impression would probably strike the average American who has been to England as fairly correct. Particular observations would also commend themselves—as that England is decidedly a man's country, the women distinctly subordinating themselves to their husbands and fathers and brothers, and demanding for themselves far less than their American sisters; that it is also a land of tips, the usage prevailing in far higher walks of life than with us; that the men in England, so far from being as a rule morose and surly in their intercourse with one another, are rather more cheerful and boyish than Americans; that the reading habit is less common and widespread than on this side, although the scholar class may surpass ours in thoroughness; and that the density of the lowest-class English exceeds any conception the untravelled American can possibly have of it.

The Philosophy of Long Life. By Jean Finot. Translated from the French by Harry Roberts. New York: John Lane Co. $2.50 net.

The French people, no less than their dashing journalist who gives us this book, evidently agree with H. G. Wells that self-deception is the anæsthetic of life. They have bought out fourteen editions of "The Philosophy of Long Life," and their reviewers have lauded it profusely as a death-bed consolation. M. Finot is the smiling philosopher who has dispelled the terrors of old age and dissolution by invoking against them the "rigorous" teachings of modern science. It shatters one's inherited faith in French astuteness to discover that the chapters thus extolled are, in reality, neither philosophical nor scientific nor yet brighteners of life.

M. Finot first shows that some people live longer than others; that temperance and out-of-door life better one's chances of filling out a century; and that public hygiene, assisted by medical research, is slowly lengthening the average span. His proofs are a strange jumble of newspaper clippings, old wives' tales, and even less trustworthy legends. Roger Bacon's nonacentenarian and Niemens of Cugua, the 370-year-old Bengalese, are cited along with the longevity cases from contemporary insurance records. The tales of extreme age among our Southern negroes are accepted as confidingly as Metchnikoff's masterly studies. And, at the end, we are left with nothing richer than the oft-repeated hope of the Pasteur Institute, that old age *may* prove to be a disease whose onslaught can be postponed.

Turning to the mystery of death, M. Finot puts a guess in the place of every wanting fact. His attempt to take away its imaginary sting results in a grotesque play upon Claude Bernard's hackneyed thought that life is death and death life:

> The laugh which makes our faces beam, the thought which wrinkles our forehead . . . are always accompanied by a death of the cells.

On the other hand, death is the beginning of a new life:

> The body still lives under ground. Its life, though of a different nature, does not cease to be life in the biological sense. . . . Putrefaction is a modification of the molecular balance of a substance.

And this decomposing matter itself is animate; has not "the new physics," with its evolution of atoms, proved Hylozoism?

In short, M. Finot glosses over the difference between the two states by dwelling on their chemical resemblances and by pretending that the wearing out of a living cell (catabolism) is identical with the suspension of the cell's function (death). His "gospel of love and kindness" finds its deepest solace in the joy of the worms over man's last discomfiture. A more hideous caricature of optimism was never drawn. Its alleged popularity is only fresh evidence of the blight cast by pseudo-science on many minds.

Science.

Artificial and Natural Flight. By Sir Hiram Maxim. New York: The Macmillan Co. $1.75 net.

Sir Hiram Maxim is one of the most distinguished of the more recent pioneers in aviation. Like Ader, Kress, and Langley, he failed to produce the first

really practical flying machine because he undertook too much at once, *i. e.*, to build a full fledged dynamic flyer, carrying a man, before he thoroughly knew how it was to be managed and to preserve its balance in the turmoils of the wind. He did, however, greatly advance the art and furnished important data to others. He now gives a résumé of his work in this little book of 165 pages, so that a more accurate title would be: "My Experiments in Artificial Flight." Sir Hiram is a very ingenious and able engineer, intensely practical and scornful of theories. The reader will frequently be amused with his flings at the mathematicians who undertake to solve the problem of flight by formulæ based upon insufficient data. He believes in experiment and observation and gives some interesting remarks upon air currents and the flight of sailing birds as well as kites, and also a chapter on balloons, the day of which he believes to be past.

Sir Hiram began his principal experiments in 1889. He first ascertained the efficiency of aeroplanes, screws, condensers, etc., and the resistance of various shapes attached to a rotating arm or "whirling table," and then built from his own designs a very large aeroplane flyer, weighing some 8,000 pounds, with 4,000 or more square feet of sustaining surfaces, carrying three men and equipped with driving screws, condenser, and a compound steam engine (363 horse-power) of marvellous lightness. This was tested many times in captive flight to ascertain its general behavior. It finally burst through its retaining track, entering upon free flight for a few hundred feet, but proving so unstable in the wind that it soon fell and was broken on alighting. It has not been rebuilt, for various reasons, but we hope Sir Hiram will find leisure to carry out the suggestions which he offers in his chapter, "Hints as to the Building of Flying Machines."

The greater part of the book appears to have been written early in 1908, for doubts are expressed as to the reported performances of the Wright brothers, while credence is given them in the appendix. Mr. Maxim holds that all machines that have met with any success have been made on the same general lines, which do not differ greatly from those of the large machine which he made at Baldwyn's Park many years ago.

Dr. A. T. Schofield, who has already written at length on functional nerve diseases, seeks in "Nervousness," a little book of eighty pages (Moffat, Yard & Co.), to encourage the moral treatment of such troubles. He aims apparently at the layman, although many physicians might well heed the lesson. The doctrine of the subconscious mind and that the troubles of the neurasthenic or the neuromimetic are by no means imaginary diseases, although due to the imagination, is the basis of his argument. In the matter of treatment Dr. Schofield holds that some form of suggestion acting on the unconscious mind is the true therapy, drugs being commonly of little or no value. For hypnotism in this connection he has only condemnation. The personality of the physician seems to him the important thing and he looks favorably upon the "Emmanuel Movement." Little is said of diagnosis, already elsewhere fully treated by him, but somewhat more emphasis might well be laid on the importance of carefully determining that the disease really is functional, a work which cannot be undertaken by a layman, however good his intentions. The fact that quacks—not the blatant quacks that seek to persuade people to be ill, but well meaning, even pious quacks—are successful practitioners of medicine seems to escape the author's attention. And what of the possibility that an unconscious mind may act on another unconscious mind in a beneficial manner?

From Neustadt comes the report of the death of Dr. Georg von Neumayer, at the age of eighty-two. As early as 1857 he came to the conclusion that Melbourne was the best place for physical observation, and established a station there which was afterward taken over by the British government. In 1864 he returned to Germany, and in 1872 was made head of the Hydrographic Department of the Admiralty. Among his publications are: "Magnetical, Meteorological, and Nautical Observations," "Discussion of Magnetic and Meteorological Observations Made in Melbourne, 1857-64," "Anleitung zu wissenschaftlichen Beobachtungen auf Reisen," and "Die Beobachtungen der deutschen Stationen im System der internationalen Polarforschung."

Drama.

The Bancrofts: Recollections of Sixty Years. By M. and S. Bancroft. New York: E. P. Dutton & Co. $5.

These reminiscences of Squire Bancroft and his wife, Marie Wilton, although, like most theatrical autobiographies, they contain much that is superfluous and trivial, and bear the familiar marks of that naïve egoism which seems to be the inevitable consequence of life before the footlights, make pleasant reading, and really constitute a valuable record. Few stage performers of modern times have had more reputable or more successful careers; few have contributed more to the honor of their profession; few have more thoroughly deserved the rewards which fortune showered upon them. Unendowed with the supreme gift of genius, both fought their way to the front rank by dint of hard work, aided by sound natural intelligence, and, when once united in matrimony and management, they faithfully strove together for the best artistic results.

Marie Wilton's earliest experience was in the legitimate. She was Fleance to the Macbeth of Macready. Later she played Arthur to the Constance of Miss Glyn, a pupil of Charles Kemble and a tragic actress of rare intuition and power. After that she drifted into the company of the Bristol Theatre, then famous under the rule of Chute, a capable man and exacting teacher. Kate and Ellen Terry, Madge Robertson, Henrietta Hodson, Charles Coghlan, and many another notable performer were graduates of his school. Soon she made so marked a hit as the boy in "Belphegor" that Charles Dillon took her to London, where she at once attracted attention, especially as Perdita in a burlesque of "The Winter's Tale" by William Brough. Her next triumph was as a boy in one of Byron's extravaganzas, and so she reached the Strand Theatre, of which she was one of the leading attractions in boys' parts for years. Dickens, no mean judge, was almost extravagant in her praise. But she never got more than $45 a week in those days, public favorite as she was.

As for Brancroft, he too learned his trade in a severe apprenticeship in the provinces. In four years he played 350 parts, of every imaginable description. Much of his experience was gained in Birmingham, Dublin, and Liverpool, and it was in the last named city that he first met Marie Wilton, who induced him to go to London. There he soon became a member of the company which his future wife and H. J. Byron organized for the now famous experiment with the despised old Queen's Theatre, then contemptuously called the dust-hole. Marie Wilton's capital was $5,000, of which only $750 remained when the dilapidated structure had been transformed into the dainty Prince of Wales's Theatre. It is unnecessary now to rehearse the details of that famous campaign, of which the whole world knows the history. But it is worth while to glance at some of the results. Doubtless the Bancrofts owed much to Tom Robertson's plays, which—whatever their defects, according to some of the canons of latter-day criticism—unquestionably opened up what was at that time a new and rich dramatic field. But it must not be forgotten that they gave Robertson his chance and backed him with all the resources of a most liberal and enlightened policy. Illustrious French critics admitted that their representations were worthy of the best Parisian stage. They did actually found a new school, and wrought something like a revolution in the degenerate early Victorian Theatre. The public appreciation of their work was instant and permanent, and their profits, for that period, were enormous. But from the first they shared their prosperity with their company. To meet their increasing expenses they

were obliged to raise the prices of admission. They were the first managers in London to charge $2.50 for an orchestra stall.

The value of their system, that of the ideal stock company, was manifested in the most striking way, when the Robertson series of comedies was at last exhausted. A common criticism was that they could excel only in "teacup and saucer comedy," but one of their most brilliant successes was in "The School for Scandal," and from this they proceeded, in due course, with equally good results, to "The Rivals," "Money," "Diplomacy"—in which Marie Wilton, the former burlesquer, proved herself fully equal to the difficult part of Zicka, and many other memorable achievements.

They were able to return to dignified ease after twenty years of almost unprecedented prosperity. They abandoned management, Mr. Bancroft says, simply because they saw that it would be impossible to keep their company up to its high level in the face of the commercial competition of the star and syndicate system. Undoubtedly Mr. Bancroft was a manager of extraordinary capacity and astuteness. It was he who suggested to Harry Irving, in the Bateman days, that a policy similar to that which he had observed at the Prince of Wales's would pay at the Lyceum. But, he adds, "spending is one thing and waste another."

In this rapid sketch many interesting incidents in the notable careers of Sir Squire and Lady Bancroft, as they are now known, have been necessarily omitted. They are worthy pillars of the modern stage, and their book is full of interesting and often pregnant matter.

We regret to report the death at Llandridnod Wells, Wales, of the well-known dramatic author, St. John Hankin. Mr. Hankin was born in 1869. His first literary work was done for the *Saturday Review*. Since then he has written largely for the *Times* and *Punch*. His publications are as follows: "Mr. Punch's Dramatic Sequels" (1901), "The Two Mr. Wetherbys" (1902), "Lost Masterpieces" (1904), "The Return of the Prodigal" (1905), "The Charity That Began at Home" (1906), "The Cassilis Engagement" (1907), and translation of "Les Trois Filles de M. Dupont," by Brieux, for presentation before the Stage Society, 1905.

Art.

The most interesting thing in the June Burlington is the frontispiece—a photogravure reproduction of a portrait of a lady, supposed to be Margaret Wyatt, Lady Lee, attributed to Holbein. The only reason for doubt in the attribution seems to be an "unusual redness of tone," which is, of course, invisible in the reproduction. Perhaps the drawing of the arms and hands is a little below Holbein's best standard, but the perfection of spacing within the frame, the beautiful arrangement of dark and light masses, the delicate and masterly drawing of the head, and its subtlety of modelling are surely above the attainments of any contemporary. One has only to look at the other illustrations of the article on "Some Portraits of Tudor Times" to see the gulf which separates their authors from a great painter like Holbein. As the editor remarks in a foot-note:

> If we do not accept the attribution to Holbein, we must apparently presume the existence of some other remarkable master, of whom no precisely similar example is known.

It is easier to believe that Holbein, for once, painted in an unusually red tone than that some other, and quite unknown, master was capable of this exquisite work. Other interesting illustrations are of a dignified portrait of an elderly lady (Comtesse de Verrue?) supposed to be an early work of Watteau, and of two pictures by Wilson Steer which, together with a third by the same artist, have been given by Mrs. Lionel Phillips to Johannesburg as the foundation of an art gallery for that city. As well as one may judge by black-and-white translations, the pictures go some way toward justifying the profuse, not to say extravagant, praise of the writer of the accompanying article. The landscape, Corfe Castle, shows the same mingling of the influences of Constable and Monet which marks the example recently acquired by the Metropolitan Museum, but has a fine sweep of line and a largeness of composition; the figure piece, The Balcony, looks not unworthy of comparison with our own Tarbell's treatment of similar subjects of *genre*.

George P. Bankart, "architect and craftsman," as he denominates himself on the title-page of his work on "The Art of the Plasterer" (imported by Scribners), has vindicated his right to this designation by the skill, taste, and erudition displayed in this handsome book. He has furthermore rendered a real service to architects and decorators on both sides of the ocean by setting before them, through actual examples, the possibilities of a beautiful, but sadly neglected, form of decorative art. While chiefly concerned with English examples, which he illustrates and describes in surprising number and variety, the author has given a concise but admirably handled sketch of the history of decoration in stucco and plaster, particularly of the ancient Roman and the renaissance Italian developments of the art; and the treatment of British plaster work, from the middle ages down to the present time, is also historical in arrangement. But while Mr. Bankart displays the fruits of wide and careful historical research, he writes throughout in the spirit of the artist and craftsman, and with intimate knowledge of the works he describes. The technical side of the subject is not ignored, but it is not obtruded, and might well have received somewhat more prominence. The illustrations are numerous and of a remarkably high average quality, mostly photographic, but with a sufficient number of plans, sections, and details interspersed. American architects and decorators would do well to make the acquaintance of this book. There is no reason why the art it treats of should not be revived in our own modern work. It should be, moreover, interesting to study what examples remain of our own eighteenth-century plaster work before it wholly disappears. There is a good index.

From A. C. McClurg & Co. of Chicago comes an anonymous essay of fifty pages called "What Is a Picture?" followed by twelve pages of art aphorisms, which turn out to be a collection of what the author considers the most pregnant sentences of the essay, divorced from their context, and rearranged in a new disorder. There is nothing in the aphorisms or in the essay that needed to be printed.

A. M. Robertson of San Francisco publishes a thin volume of letters and notes on painting by Arthur Atkins, a young artist, who died in 1899 at the age of twenty-six. The little book also contains a portrait and half a dozen reproductions of landscape sketches in a vein apparently reminiscent of Whistler. The work is a memorial of friendship, and one can believe that the subject was a man of promise, but there is little in picture or text to appeal to a wide public.

The necessity for more stringent laws for the protection against theft of Italian works of art exposed in public places is made evident by the report of a Parliamentary committee which has just published a list of generally successful robberies made during the past five years in Tuscany alone. This list includes no less than fifty-five towns, reporting from one to twelve cases. Churches, especially their exteriors, and street shrines seem most to invite aggression. While paintings, bronzes, church silver, and marble bas-reliefs have had their attractions, Della Robbias and other terra-cottas most frequently tempt these purveyors to collectors. In one instance a modern copy was substituted for the original marble bas-relief.

The death is announced of Eugène Bourgeois, the French decorative artist. He is well known for his work on the Orléans and Invalides stations in Paris, and also for small pictures of scenes in Normandy and Brittany.

Edward John Gregory, R.A., president of the Royal Institute of Painters in Water Colors, died at Great Marlow, Eng., June 22. He was born in 1850, and learned his art at the South Kensington Museum. "Boulter's Lock" at Maidenhead on the Thames was the most popular of his paintings.

Finance.

THE REPORT ON THE EXCHANGES.

The wisdom of Gov. Hughes, in referring to a committee of private citizens the question of reform legislation for financial and commercial exchanges in this State, is as fully vindicated in the result as was his similar expedient regarding reform of the trust-company laws.

The popular indictment, out of which rose the investigation of the exchanges, was partly based on close and intimate

knowledge of Stock Exchange procedure; partly, on complete ignorance of the mechanism of exchanges. It is quite certain that a good part of the complaint against the Stock Exchange, in particular, was a complaint against speculation itself. The evils of speculation by the ignorant and credulous portion of the community were manifest. It was on the Stock Exchange that this speculation was principally carried out. Therefore, let the Stock Exchange be regulated so as to put an end to speculation. Along with this more or less vague demand came a very different criticism, based on assertions that part of the actual daily transactions on the Stock Exchange, whereby volume of business is determined and movement of prices regulated, was in reality a collusive and deceptive business, in which the same people, acting indirectly both as buyers and sellers, were using the Exchange to mislead its legitimate investment customers.

With the first of these demands the White committee deals effectively and conclusively. It does not deny that ignorant speculation is an evil. Even as to outsiders with capital, experience, and knowledge of business conditions, the committee states, as a result of its long and thorough hearings that on the average, with commissions and interest charges always running against them, and with good luck and bad luck necessarily alternating, speculation on borrowed money pretty surely ends in "forcing them out of the Street." As to the inexperienced speculators, "almost without exception they eventually lose." Nevertheless, to intervene by law with a sweeping prohibition will hardly meet the situation. "Trading on margin" has been freely and indiscriminately denounced. But the committee points out that "purchasing securities on margin is as legitimate a transaction as a purchase of any other property in which part payment is deferred." This conclusion is, in principle, hardly open to dispute, unless the buying of real estate with a 60 per cent. mortgage on it is also to be proscribed. The committee recommends, however, that no purchase of stocks ought to be allowed on less than a 20 per cent. margin of cash payment; a provision which would at least do away with the most seductive temptation and surest guarantee of loss to the ignorant speculator.

Another of the more hap-hazard demands for reform has taken the shape of proposed abolition of "short selling." It has been seriously argued that something ethically wrong is involved in selling what one does not at the time possess, and that "short sales" are a species of conspiracy to destroy legitimate values. The committee shows with great clearness, not only that the entering on a contract to deliver hereafter what the contractor does not at the moment own is a perfectly normal and proper undertaking, common to all business, but that, on the Stock Exchange particularly, it is the strongest restraining influence against fictitious and unwarranted marking-up of prices.

By far the most difficult part of the committee's labors had to do with alleged improper and illegitimate manipulation of prices, under the shelter of the Stock Exchange. This is a question which deeply affects the interests, not only of the general public, but of the Stock Exchange itself. It is an evil which, if it exists, is bound to grow to especially dangerous proportions at times when powerful capitalists and institutions are engaged in the work of fostering "bull movements." To tempt the outside public in, a semblance of violent activity and a show of already advancing prices are notoriously the readiest means, and it has been freely alleged that both these achievements have been accomplished without the awkward necessity of buying from some one else, and paying for, the mass of securities involved.

If in this matter the committee's findings and recommendations are less conclusive, that is because the matter was peculiarly complicated. Manipulation with a view to creating a market for new securities, the committee holds, "when not accompanied by 'matched orders,' is unobjectionable *per se*," and "has certain advantages" in establishing regular quotations at which investors, at the very start, may buy and sell. But manipulation "in order to draw in the public as buyers and unload upon them the holdings of the operators, or to depress the prices and induce the public to sell," is declared to be an unmixed evil. The remedy, however, is exceedingly difficult to find, save in the discipline of the Stock Exchange itself. Such is the necessary machinery of the Exchange, that distribution, even of "matched orders," may be arranged by an outside party, through the medium of brokers wholly innocent of complicity. The committee, therefore, lays the duty of restraint and reform squarely at the door of the Stock Exchange authorities themselves. "Instances of continuous manipulation," it concludes, "are patent to every experienced observer, and could without difficulty be discouraged, if not prevented, by prompt action on the part of the Exchange authorities." This is a finding which places definite public responsibility on the shoulders of the institution.

Space is lacking to take up the numerous further recommendations of the report—some of them highly important—regarding not only the Stock Exchange, but the other similar organizations in other markets. What is reviewed above is the part of the committee's task which has chiefly occupied the public mind. The report as a whole is worthy the careful study and consideration of every business man.

Third and Greatly Enlarged Edition

Geology of the City of New York

By L. P. GRATACAP, of the American Museum of Natural History. With four maps and 65 illustrations. $2.50 net, by mail $2.70

A work of first importance to engineers and students. Most of the localities described or pictured are not now, or will not be much longer, open to observation.

This new edition contains twice as much as the earlier printings; it covers all the Boroughs, with an epitome of the geology of Long Island, as well as an account of the latest investigations of the general subject.

HENRY HOLT & COMPANY, 34 WEST 33D ST. NEW YORK

STALKS ABROAD

Being Some Record of the Sport Obtained During a Two Years' Tour Round the World. By H. FRANK WALLACE. With numerous Illustrations by the Author from Photographs. 8vo. $3.50 *net.*

"This is one of the most pleasant books of sport published during recent years, full of the joy of the outdoor life, yet with many shrewd observations and criticisms of lasting value."—Country Life.

The Spy By GORKY

Now Ready, Vol. IV. France in 1877-1882
(Completing the work)

CONTEMPORARY FRANCE

By GABRIEL HANOTAUX

Four volumes, each covering a complete and definite period. Each volume complete in itself and sold separately.

8vo. With Portraits, each $3.75 net

PREVIOUSLY ISSUED.

Vol. I. France in 1870-1873.
Vol. II. France in 1873-1875.
Vol. III. France in 1874-1877.

The history of Contemporary Europe is for the first time definitely focussed in this important work. It contains new documents and new explanations of diplomatic problems, and is indeed a record of the inner diplomacy of the Great Powers of Europe during the twelve most eventful years.

Send for descriptive circular.

OUR LIBRARY SERVICE

We have recently supplemented our service to Libraries, by procuring Out-of-Print and Scarce Books, and by importing English books.

Our Educational Catalogue contains a full list of Supplementary Reading, indicating the grade to which each title is adapted.

Our Clearance Catalogue contains overstock at special prices, and an alphabetical arrangement by authors of all cheap editions of Recent Popular Fiction and Standard library 12mos in one list.

Our Library Catalogue of 3,500 approved titles, following A. L. A. lines, is of great convenience to small libraries.

Our Monthly Bulletin notices promptly every new book of importance.

These Catalogues are sent on request.

Three notable features of our service are: Promptness, thoroughness, and low prices.
